

# Introduction to Beam Physics and Accelerator Technology

Giulio Stancari  
*Fermilab*

Università degli Studi di Ferrara  
Dipartimento di Fisica e Scienze della Terra  
18-22 May 2015

[home.fnal.gov/~stancari/apufe15](http://home.fnal.gov/~stancari/apufe15)

# An overview

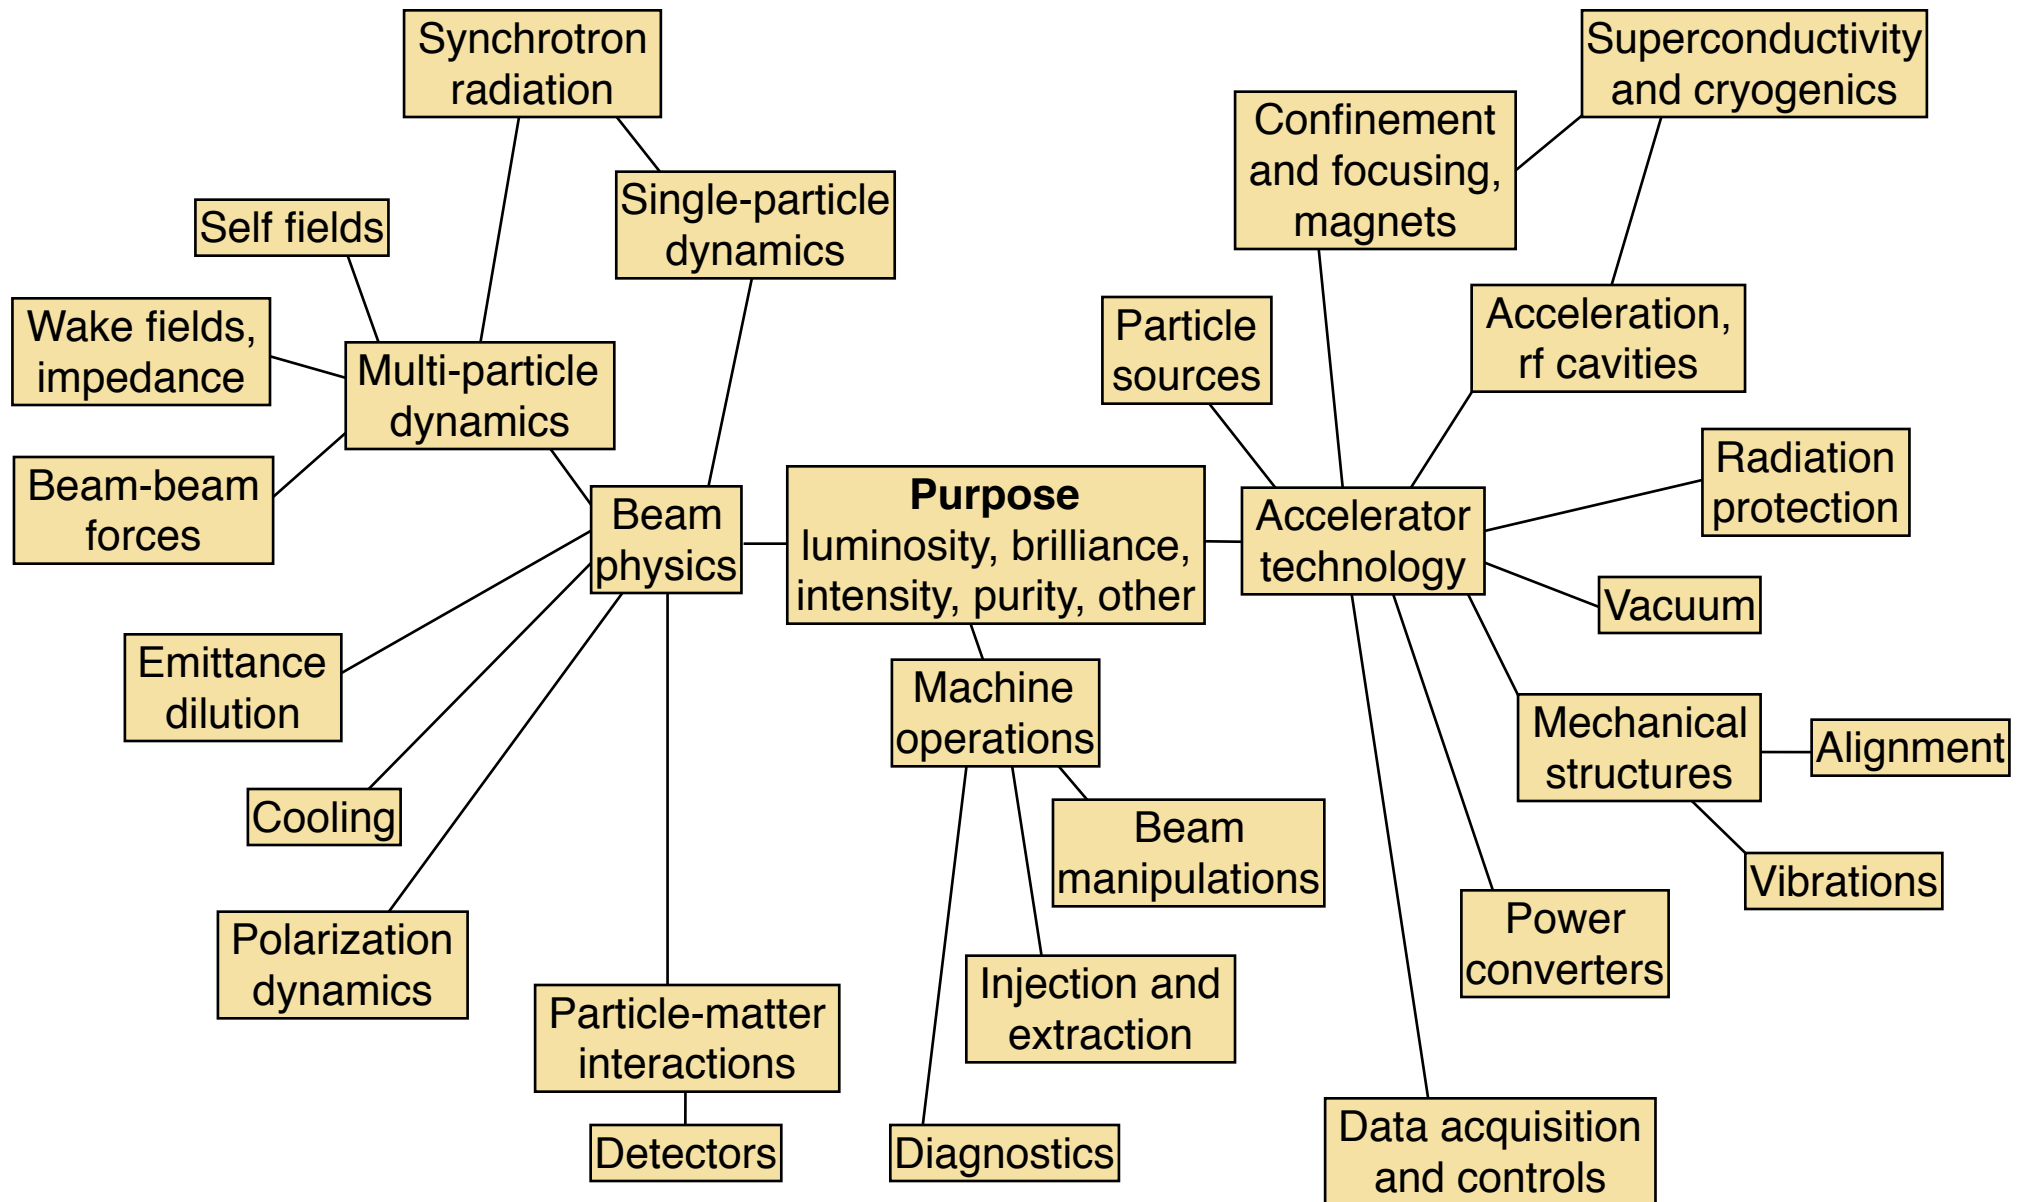

## Questions driving current research

- What can we learn about nature from experiments at accelerators?
- Can we understand and control the behavior of intense charged-particle beams?
- Are there new ways to design accelerators?
- What technologies will improve performance and reduce cost?

# Main applications of accelerators

- **Nuclear and particle physics**
  - synchrotrons, linacs, storage rings, colliders, ...
- **Biology and material science**
  - synchrotron radiation, neutrons, free electron lasers, ...
- **Medicine**
  - radiation treatment, hadron therapy, diagnostic isotope production, ...
- **Manufacturing processes**

# The field of Accelerator Physics: a concept map

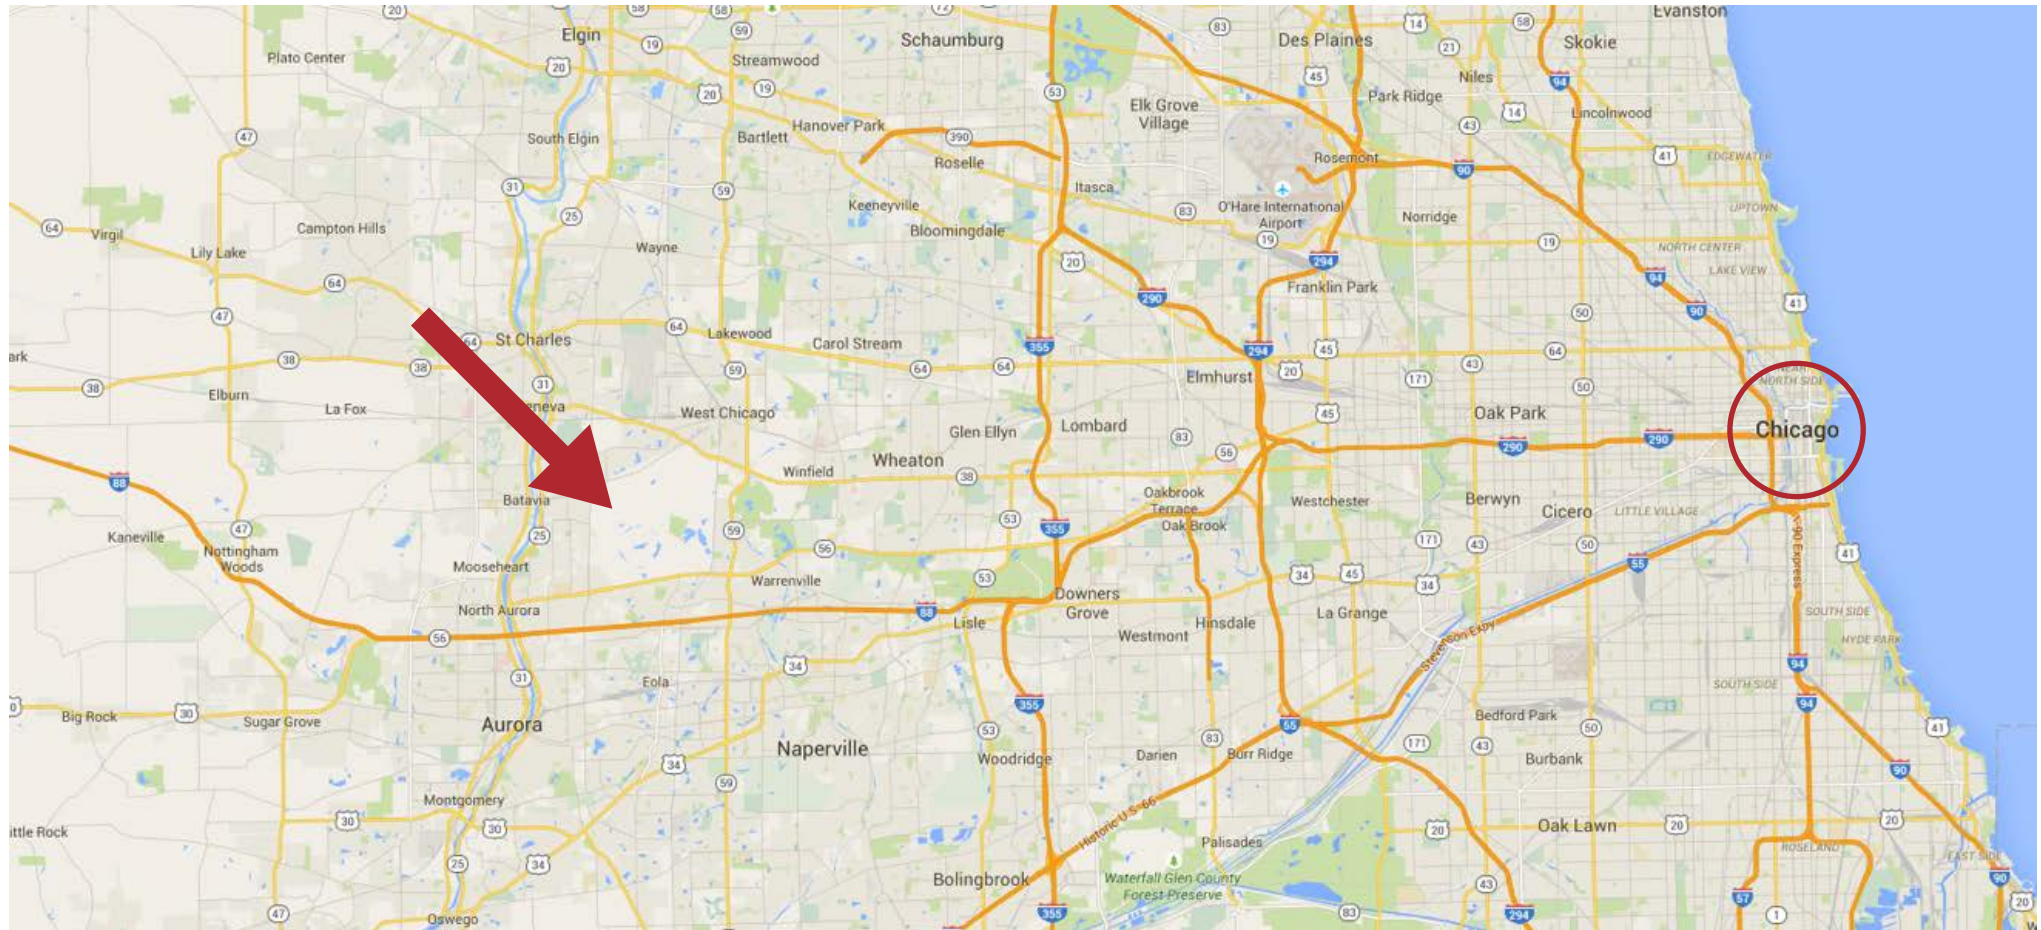

# Resources

- Textbooks
- Schools
- Internships
- Journals
- Conferences

# The Fermilab accelerator complex

# Where is Fermilab?

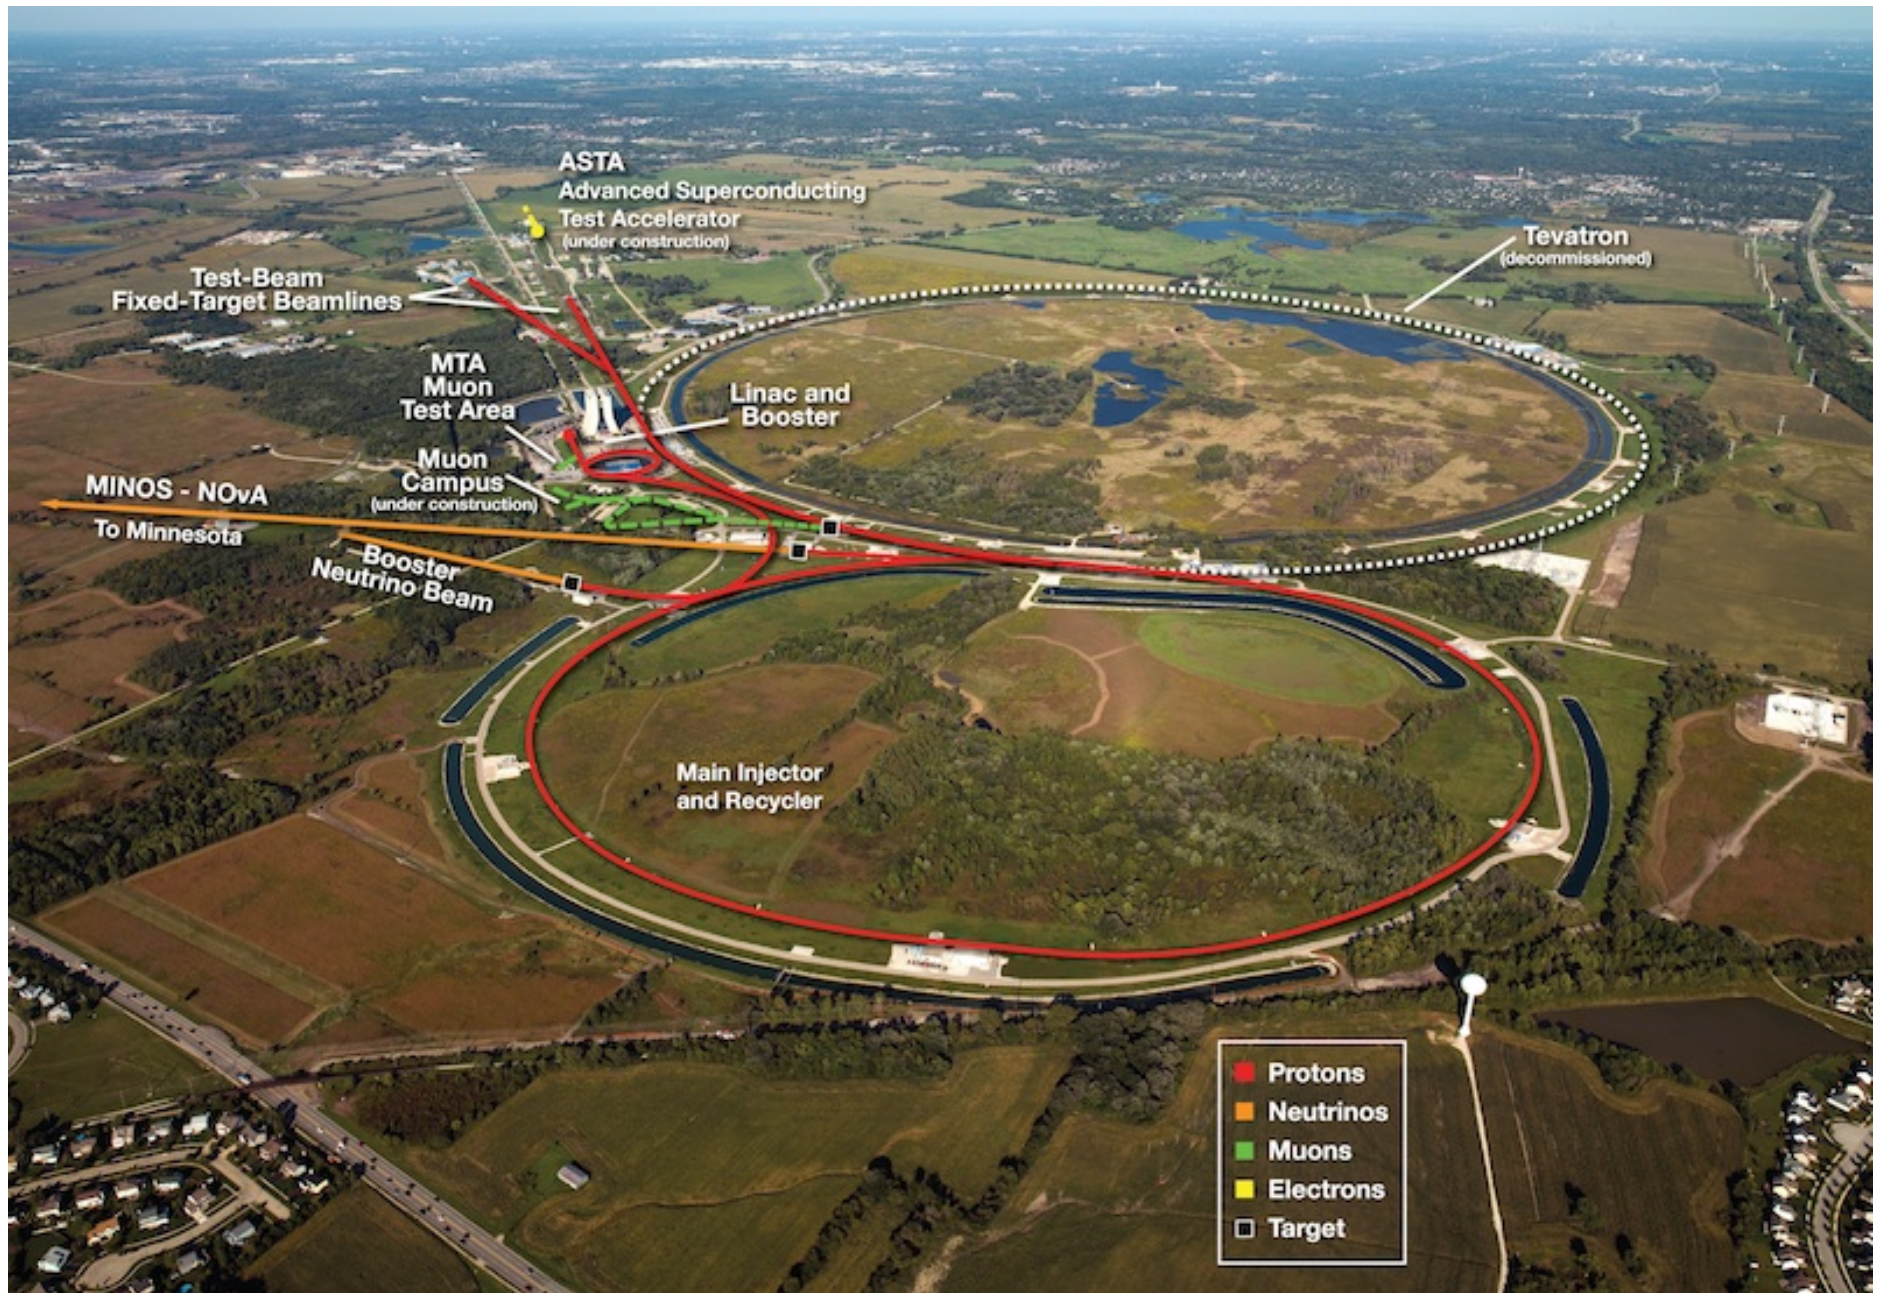

# The Fermilab campus

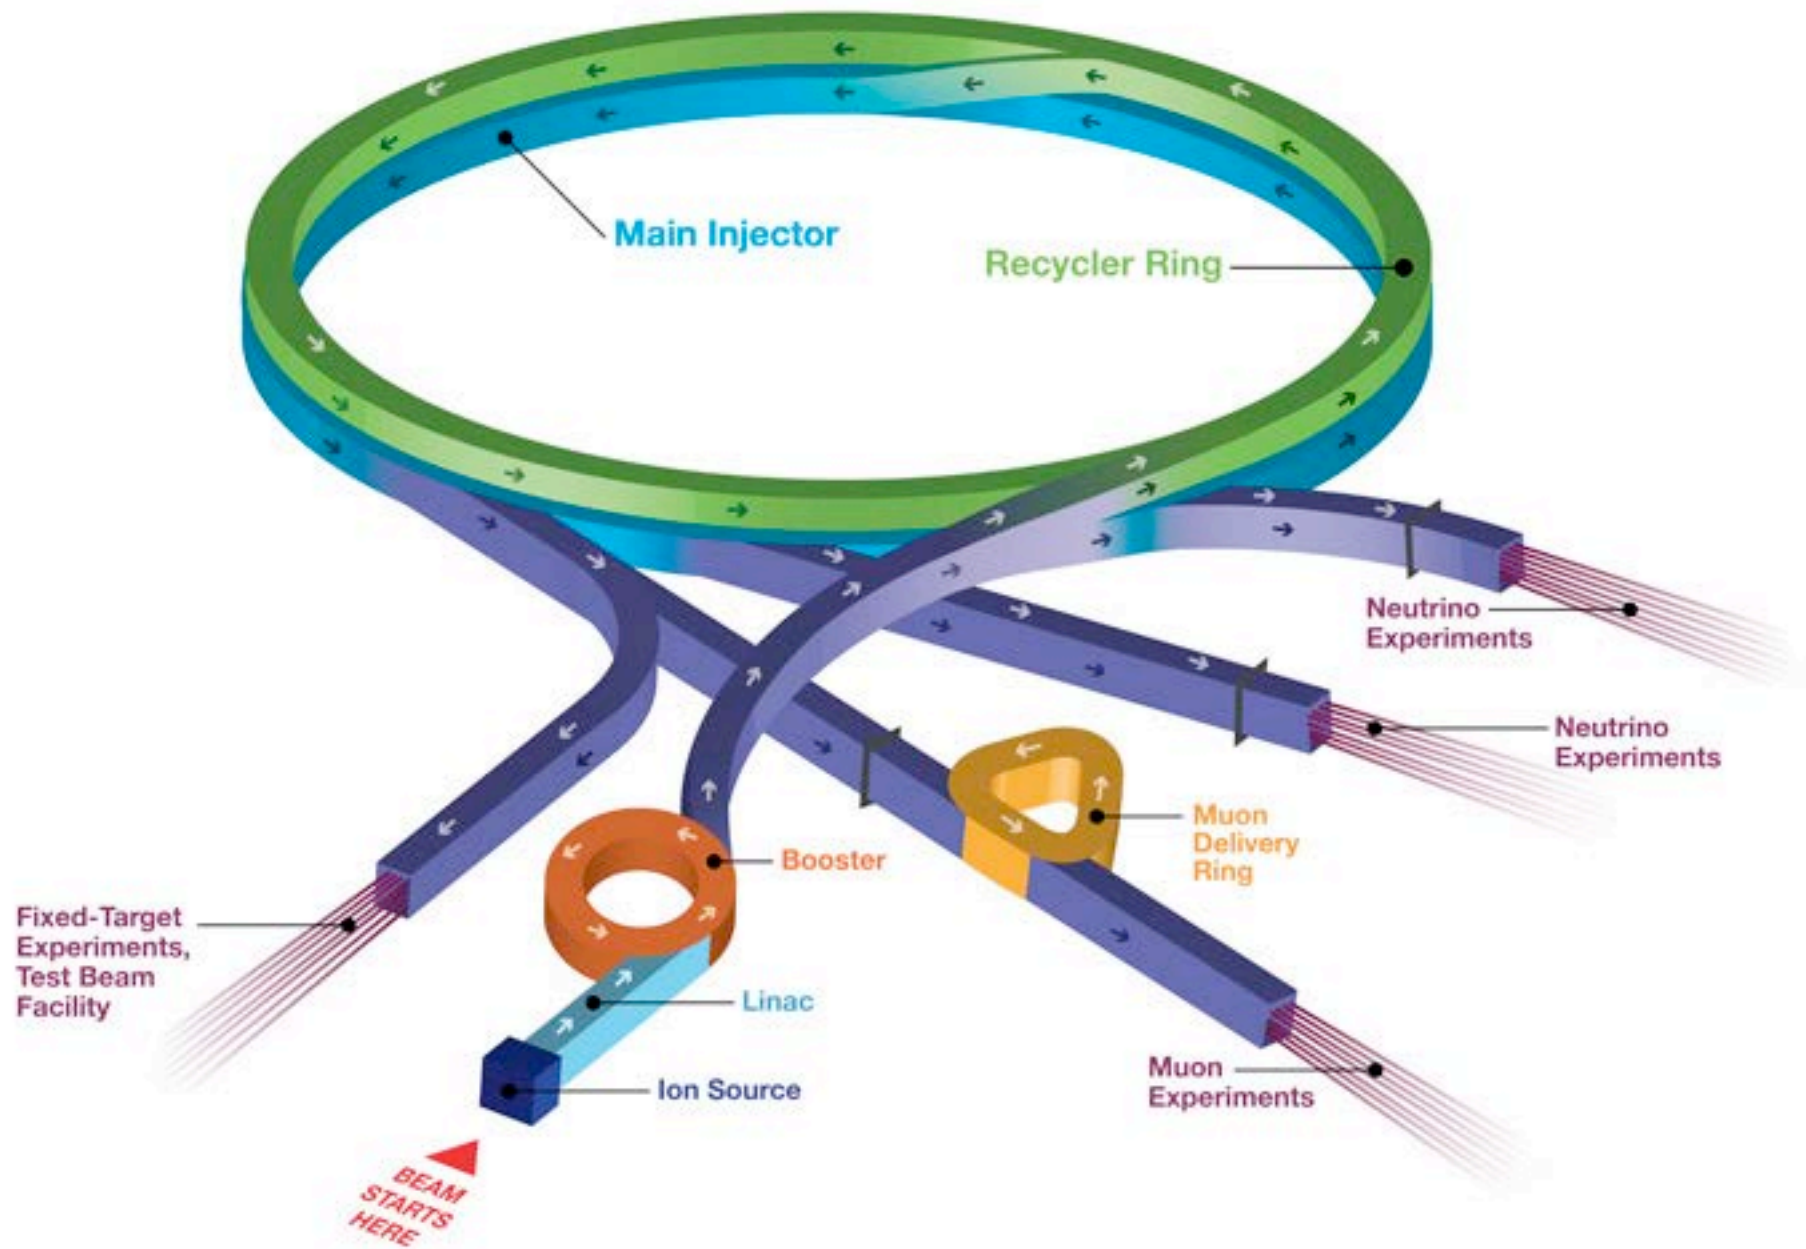

Main particle physics laboratory in US  
Thousands of international collaborators  
1700 employees  
27-km<sup>2</sup> site

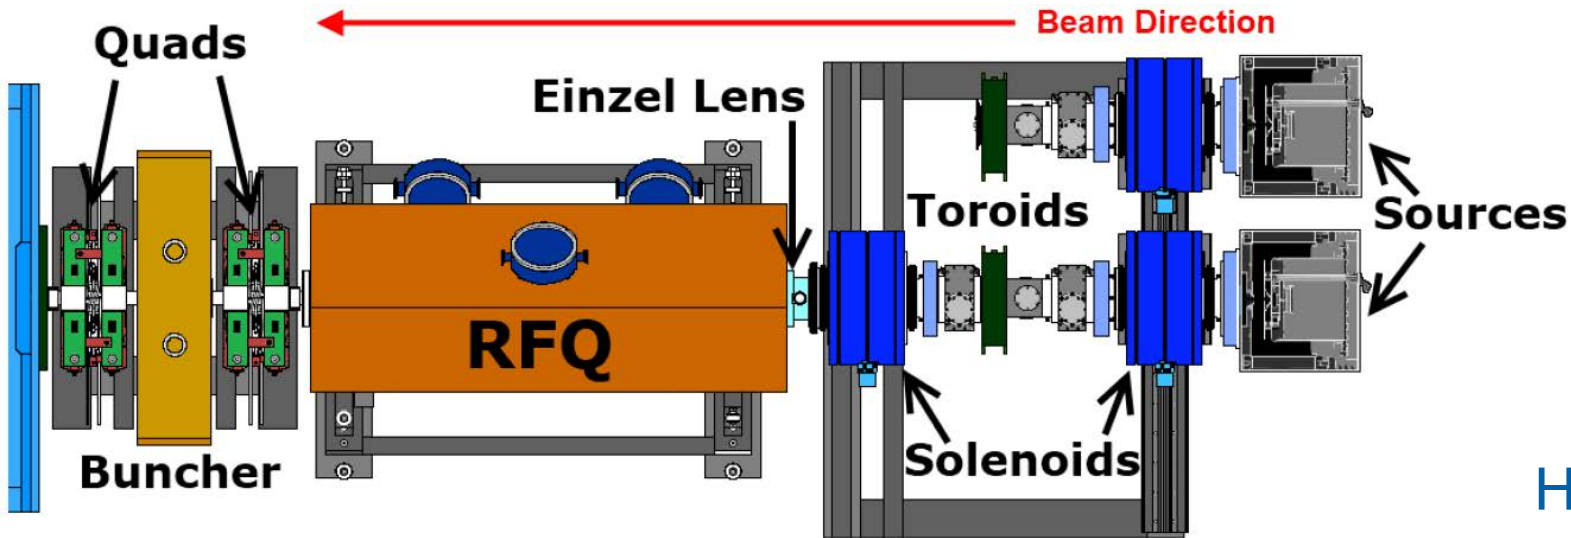

# Fermilab accelerator complex

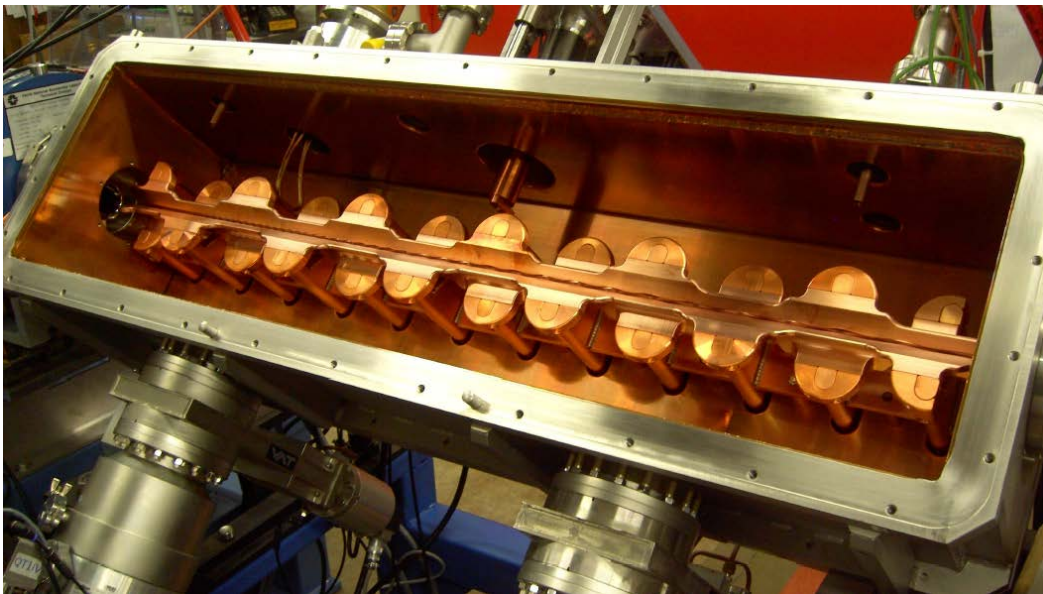

# Fermilab Accelerator Complex

# Ion source, radio-frequency quadrupole, beam transport

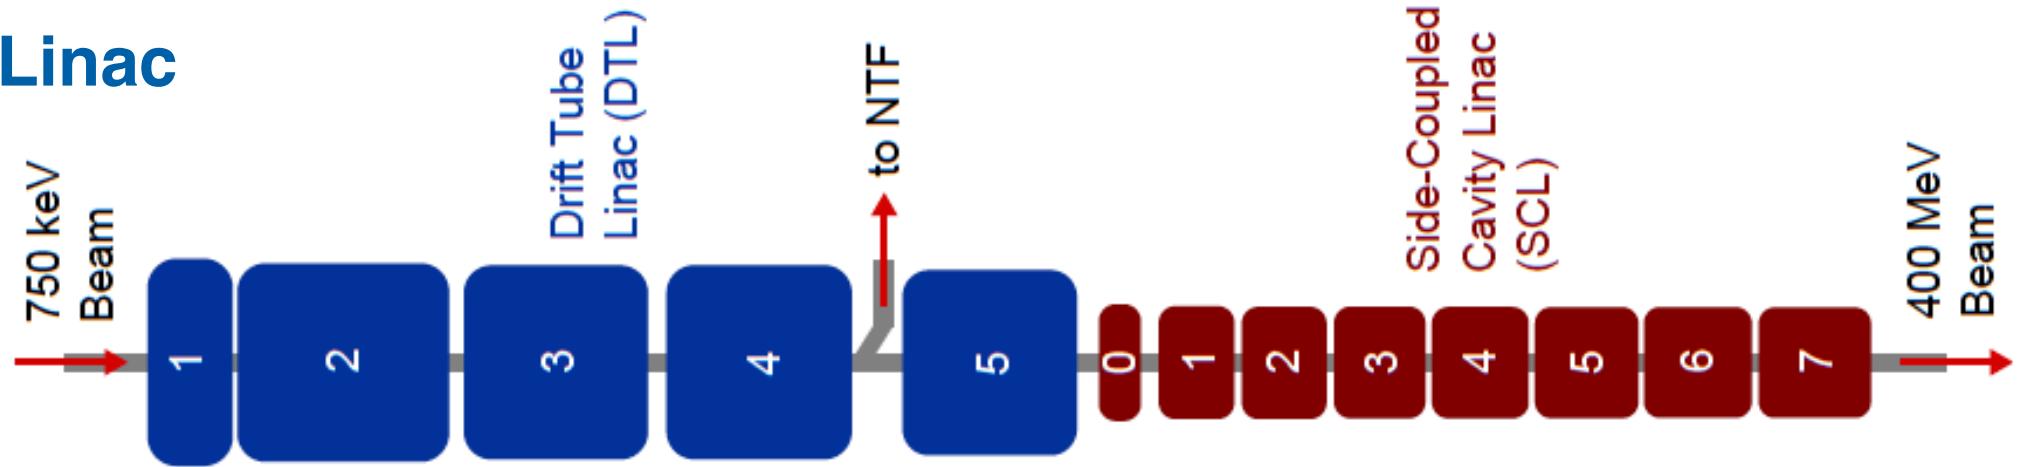

H<sup>-</sup> sources  
35 keV to 750 keV  
65 mA

RFQ focuses and  
accelerates quickly to avoid  
space-charge blowup

# Linac

Serves Booster, Neutron Therapy Facility, and Muon Test Area

# Booster

Stripping injection ( $H^-$  to protons)

Combined-function magnets (steering and focusing)

Rapid-cycling synchrotron (15 Hz)

468 m circumference

400 MeV to 8 GeV

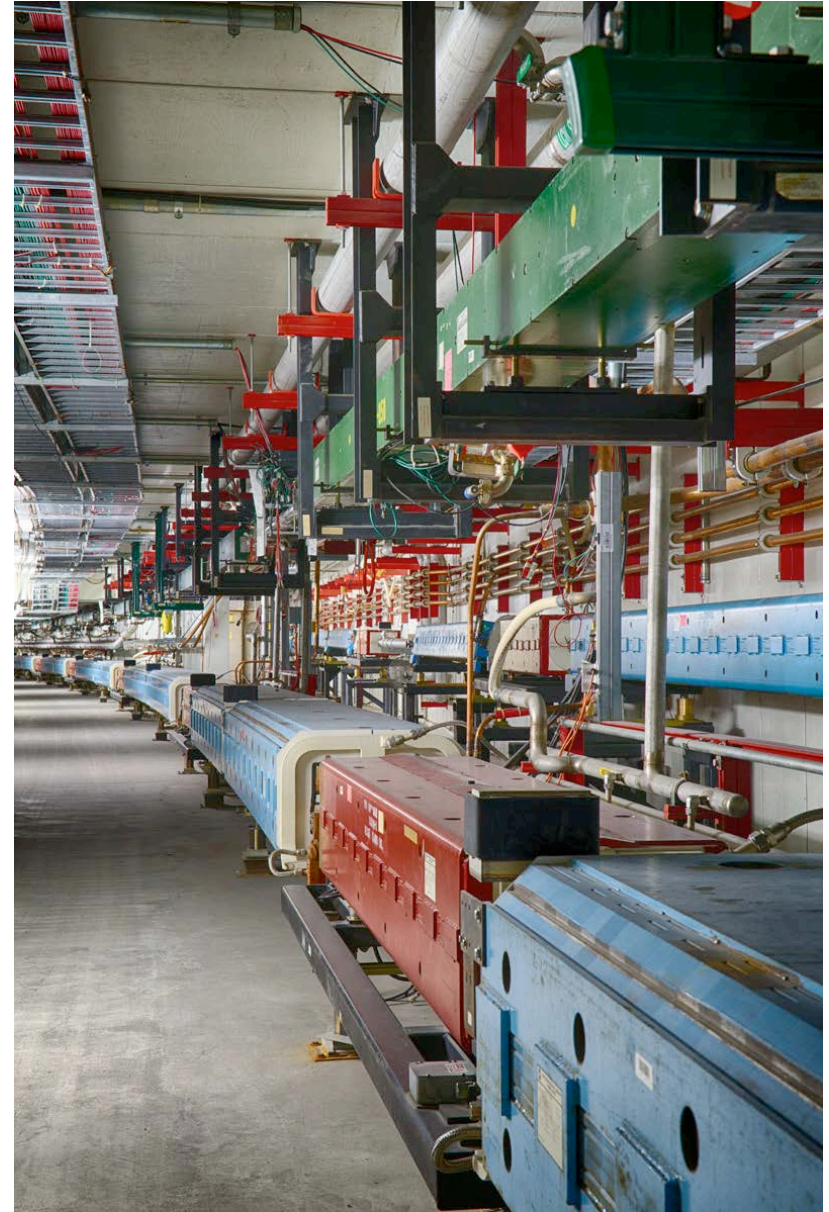

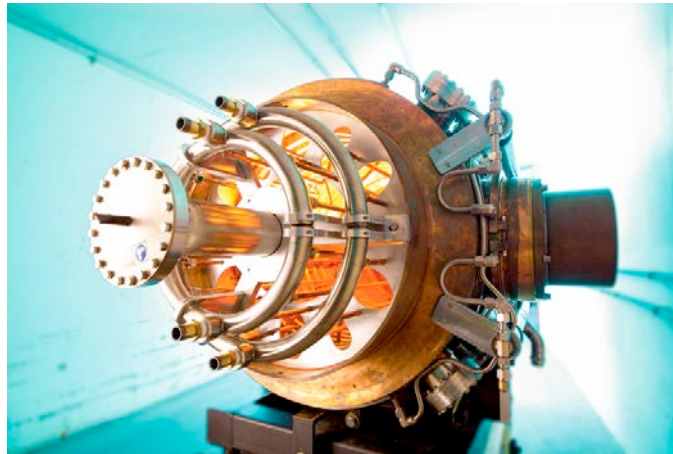

Delivers beam to Main Injector  
and to 8-GeV neutrino target

# Recycler

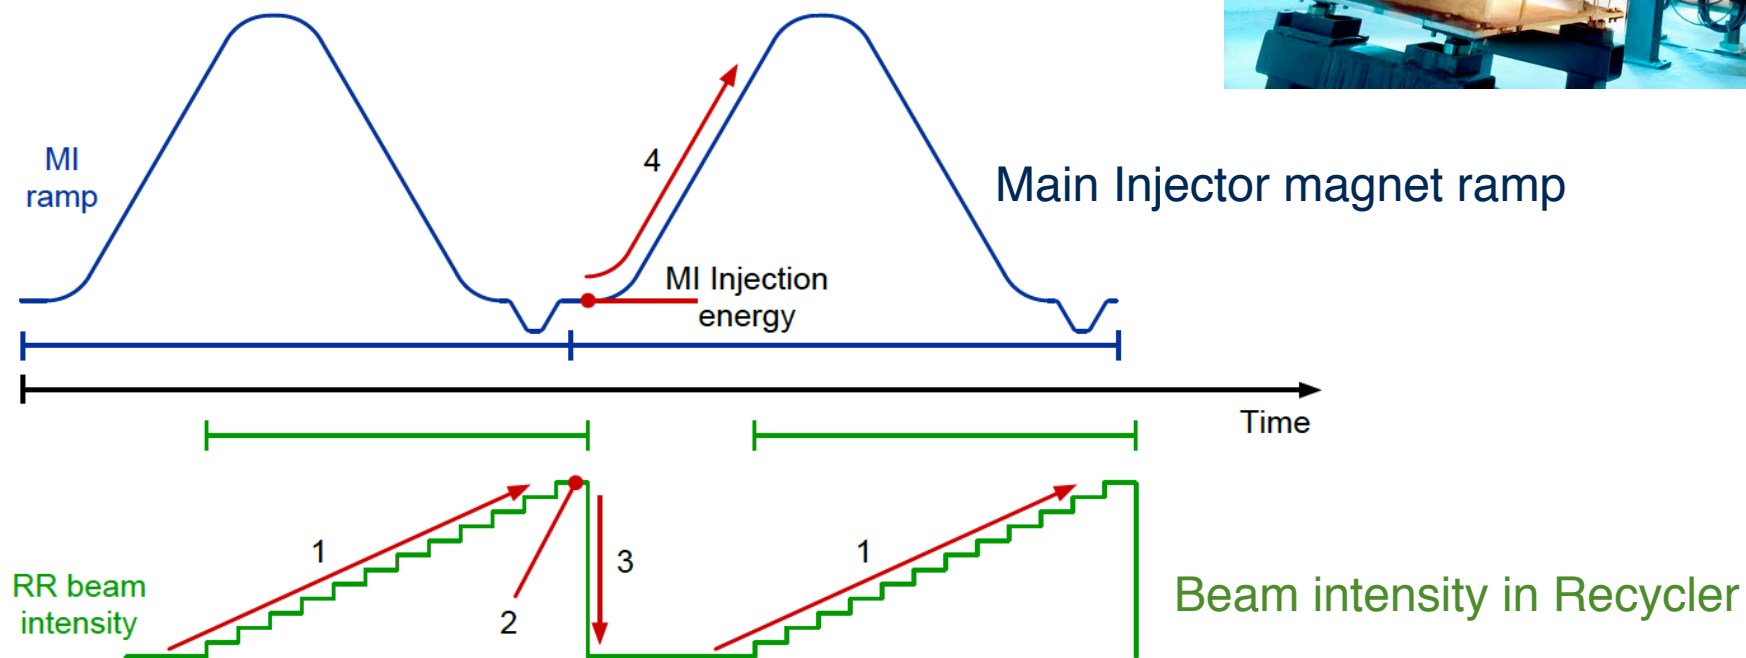

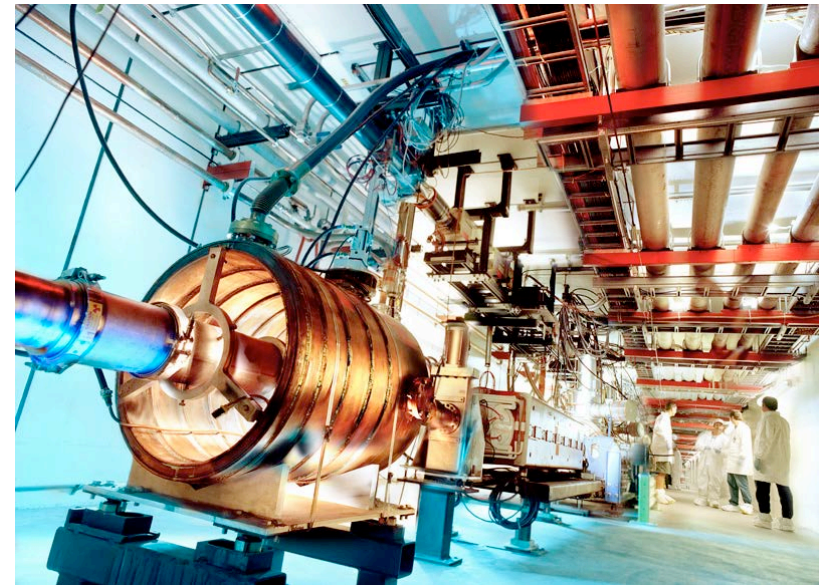

Permanent magnets  
Fixed 8-GeV energy  
3.3 km circumference

Accumulates protons during  
Main Injector ramp

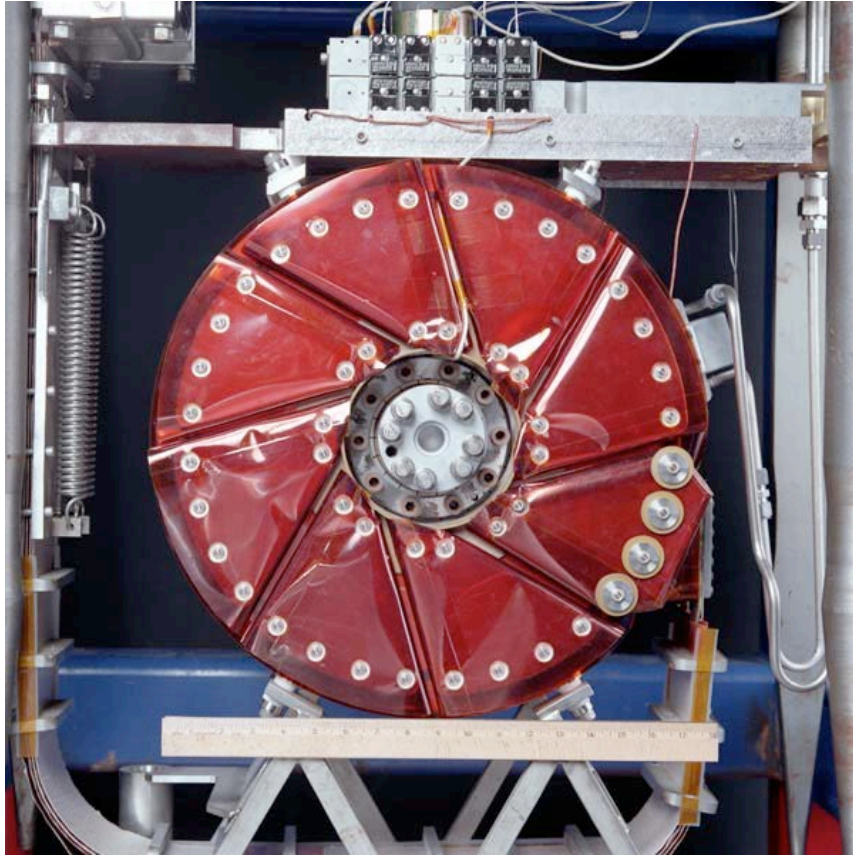

# Main Injector

Ramping synchrotron (1.3 s)  
8 GeV to 120 GeV  
3.3 km circumference

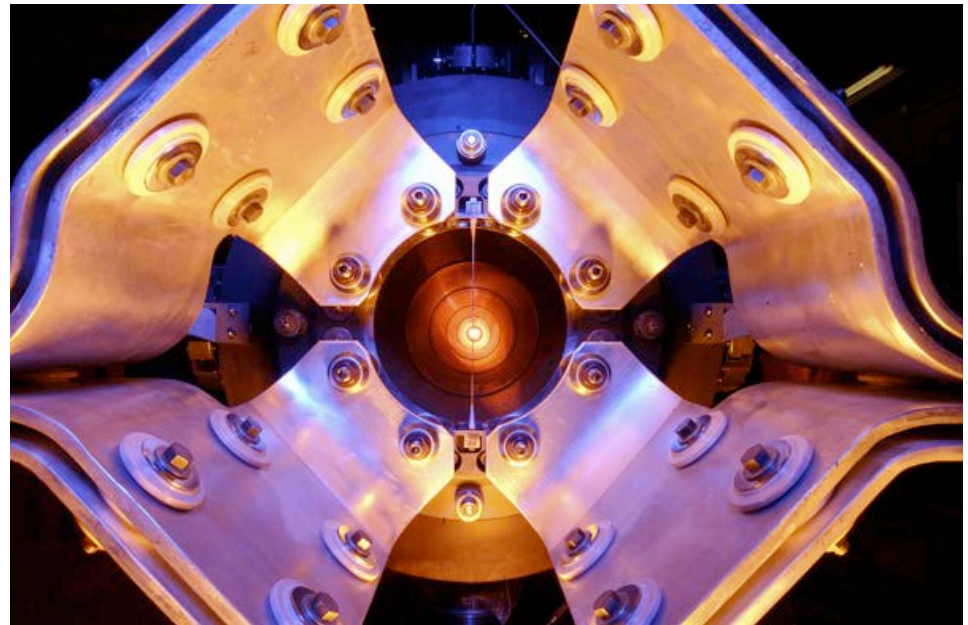

Fast extraction to neutrino target (450 kW record so far)  
Slow resonant extraction to fixed-target experiments

# Target stations

Lithium lens was used for antiproton production

NuMI horn

Challenges:  
energy deposition, kW to MW  
activation

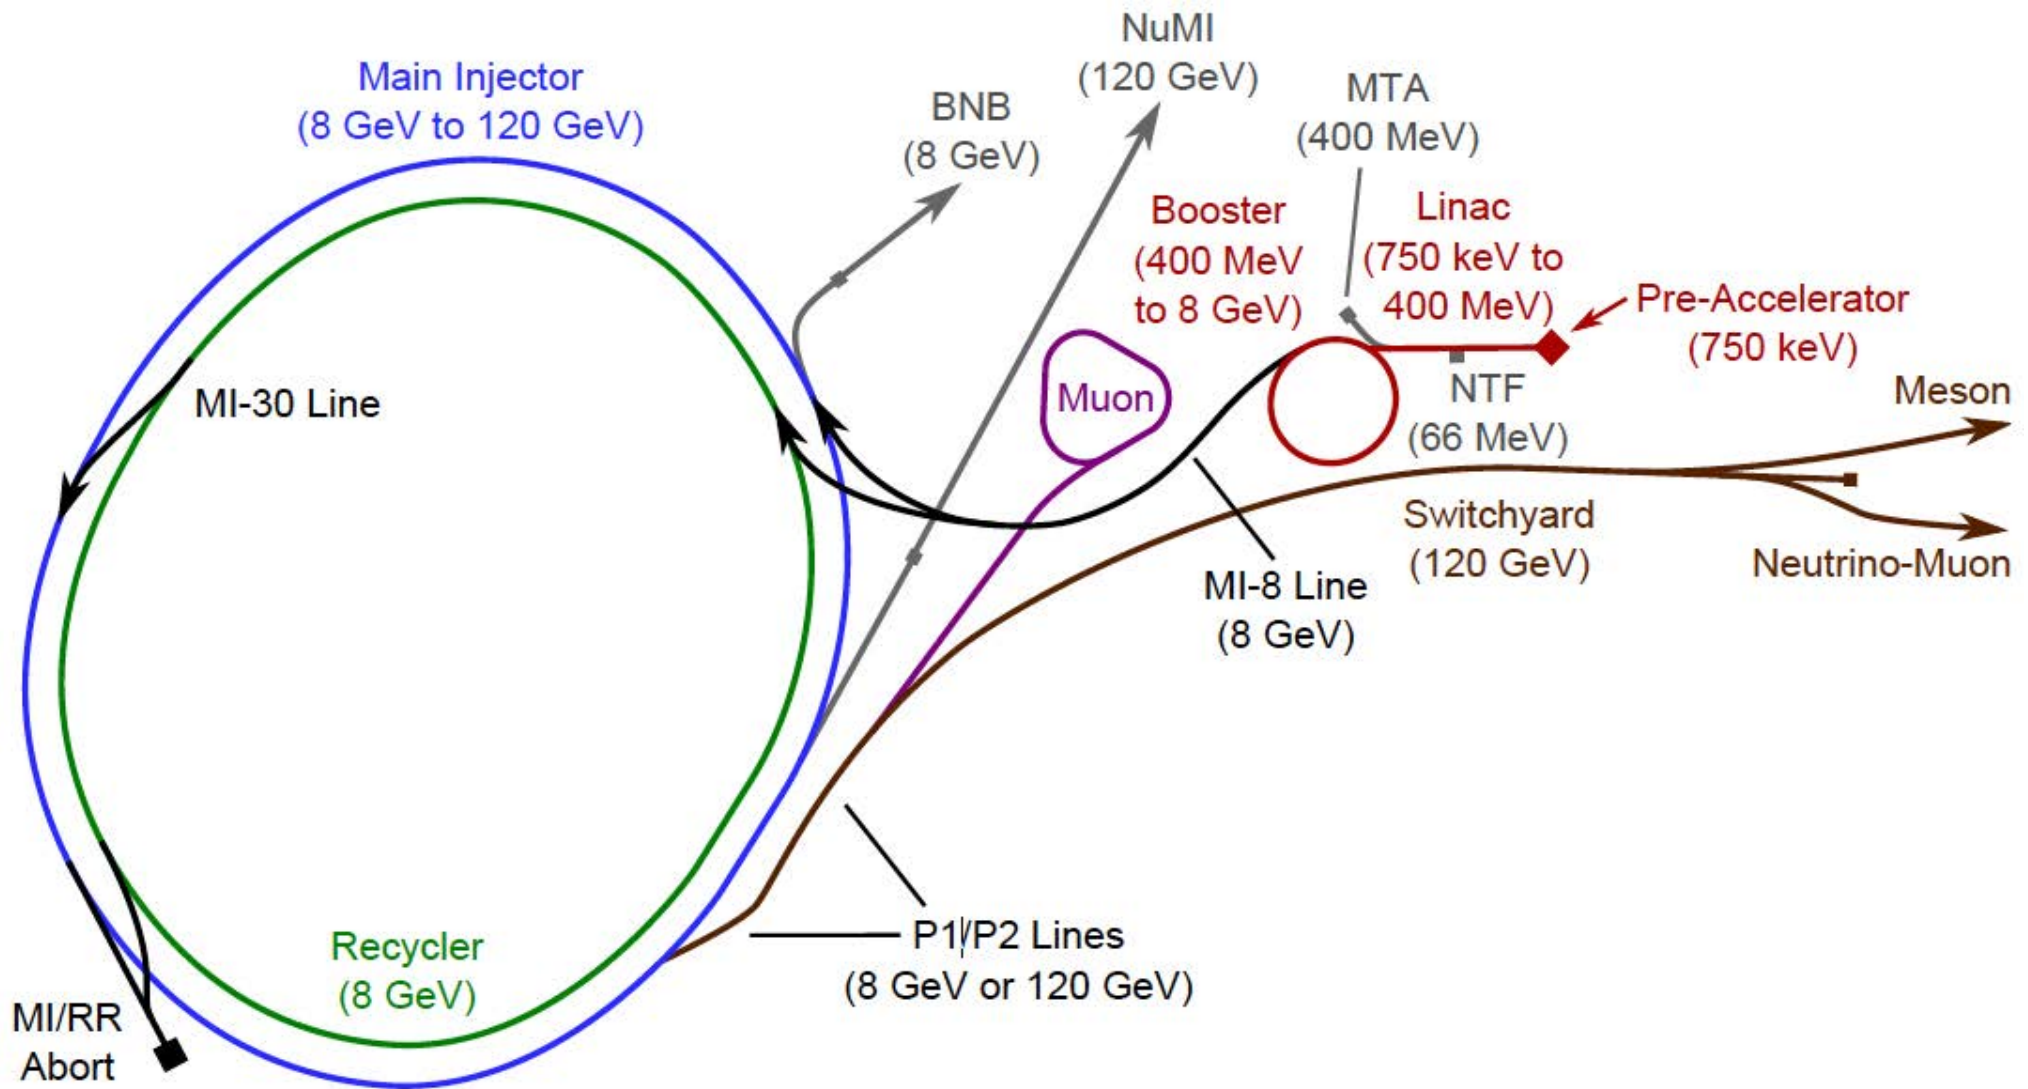

# Muon Delivery Ring

Storage ring  
474 m circumference

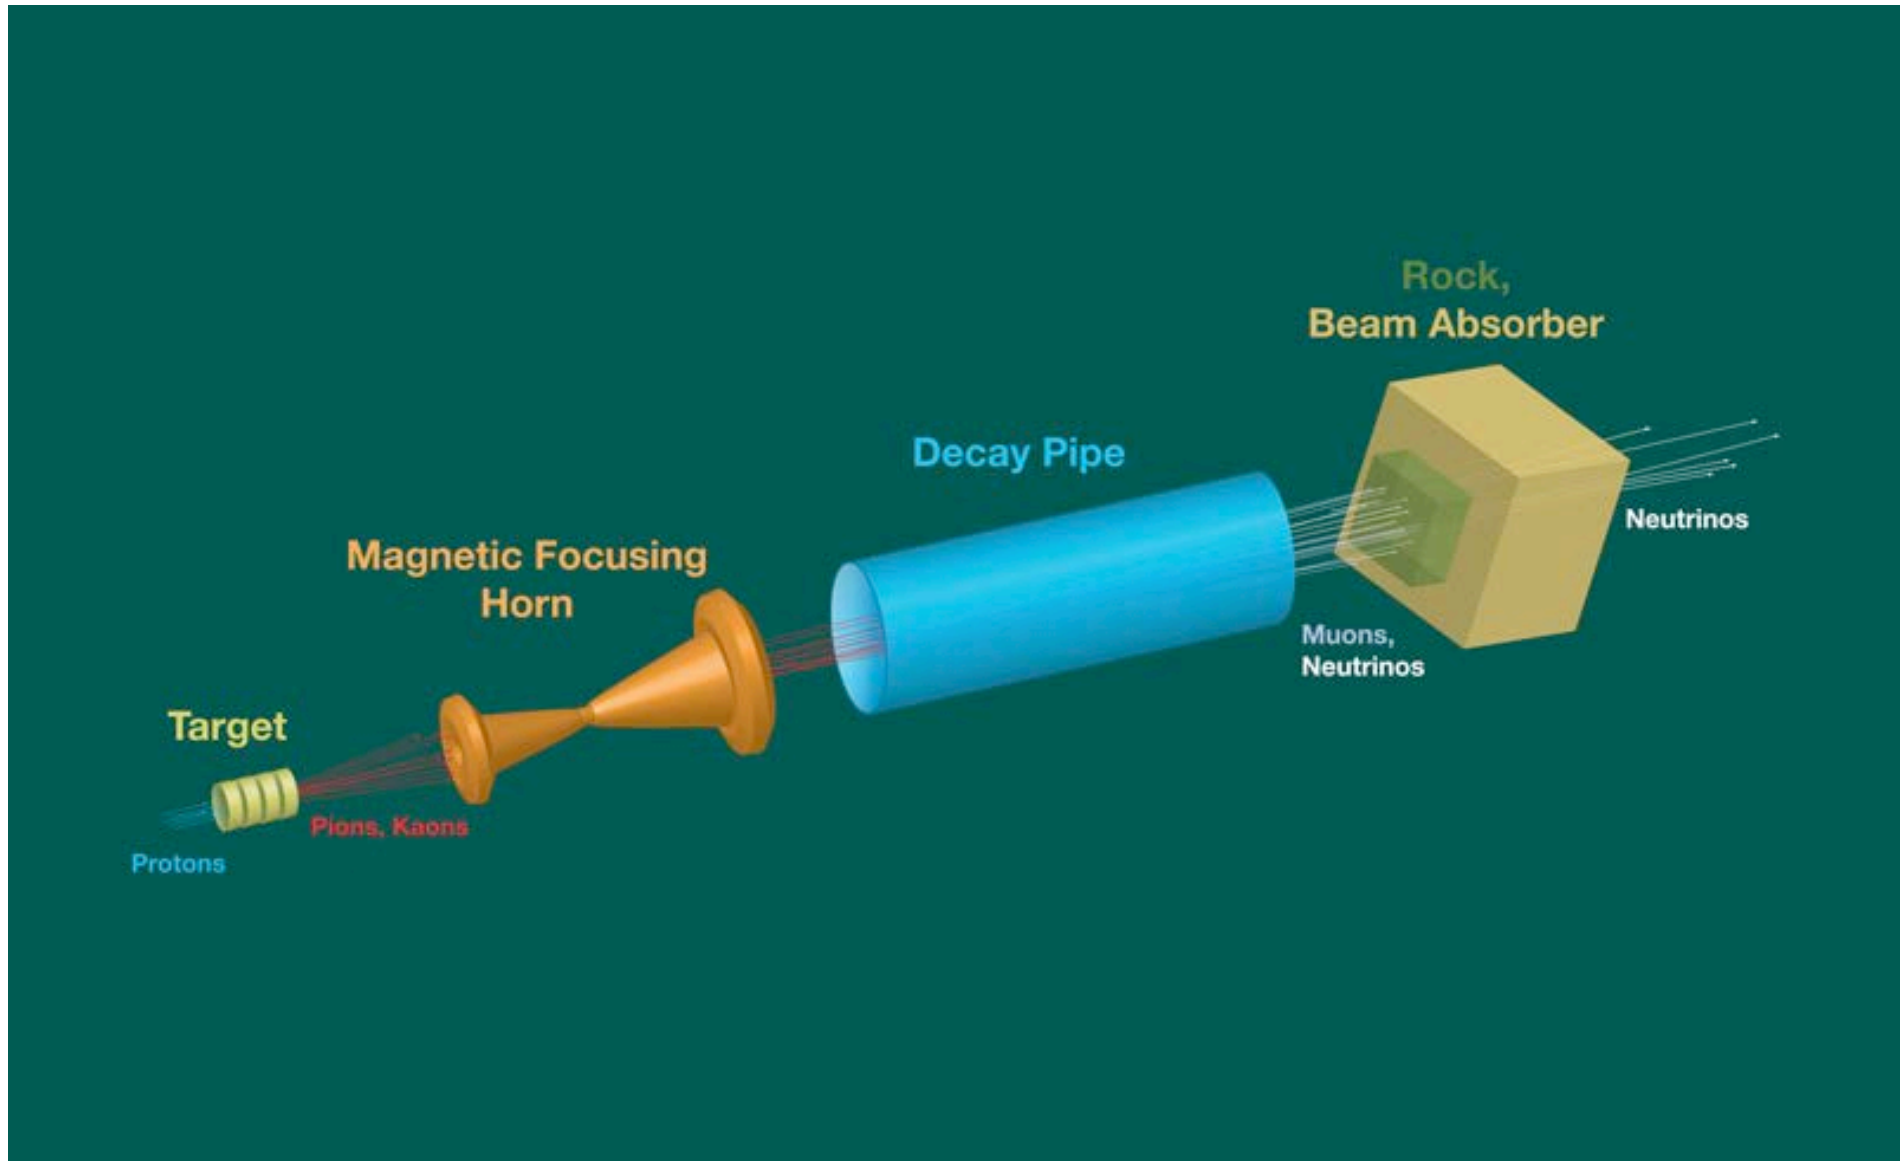

Will be used to separate muons from other particles in a few turns

# The Fermilab accelerator complex in more detail

# Limitations and challenges

- Study of neutrinos and rare decays requires intense primary beams
  - particle **losses** and **activation** must be minimized
  - **energy deposition** can damage components
  - beam **instabilities** limit maximum intensity

# Accelerator technologies at Fermilab

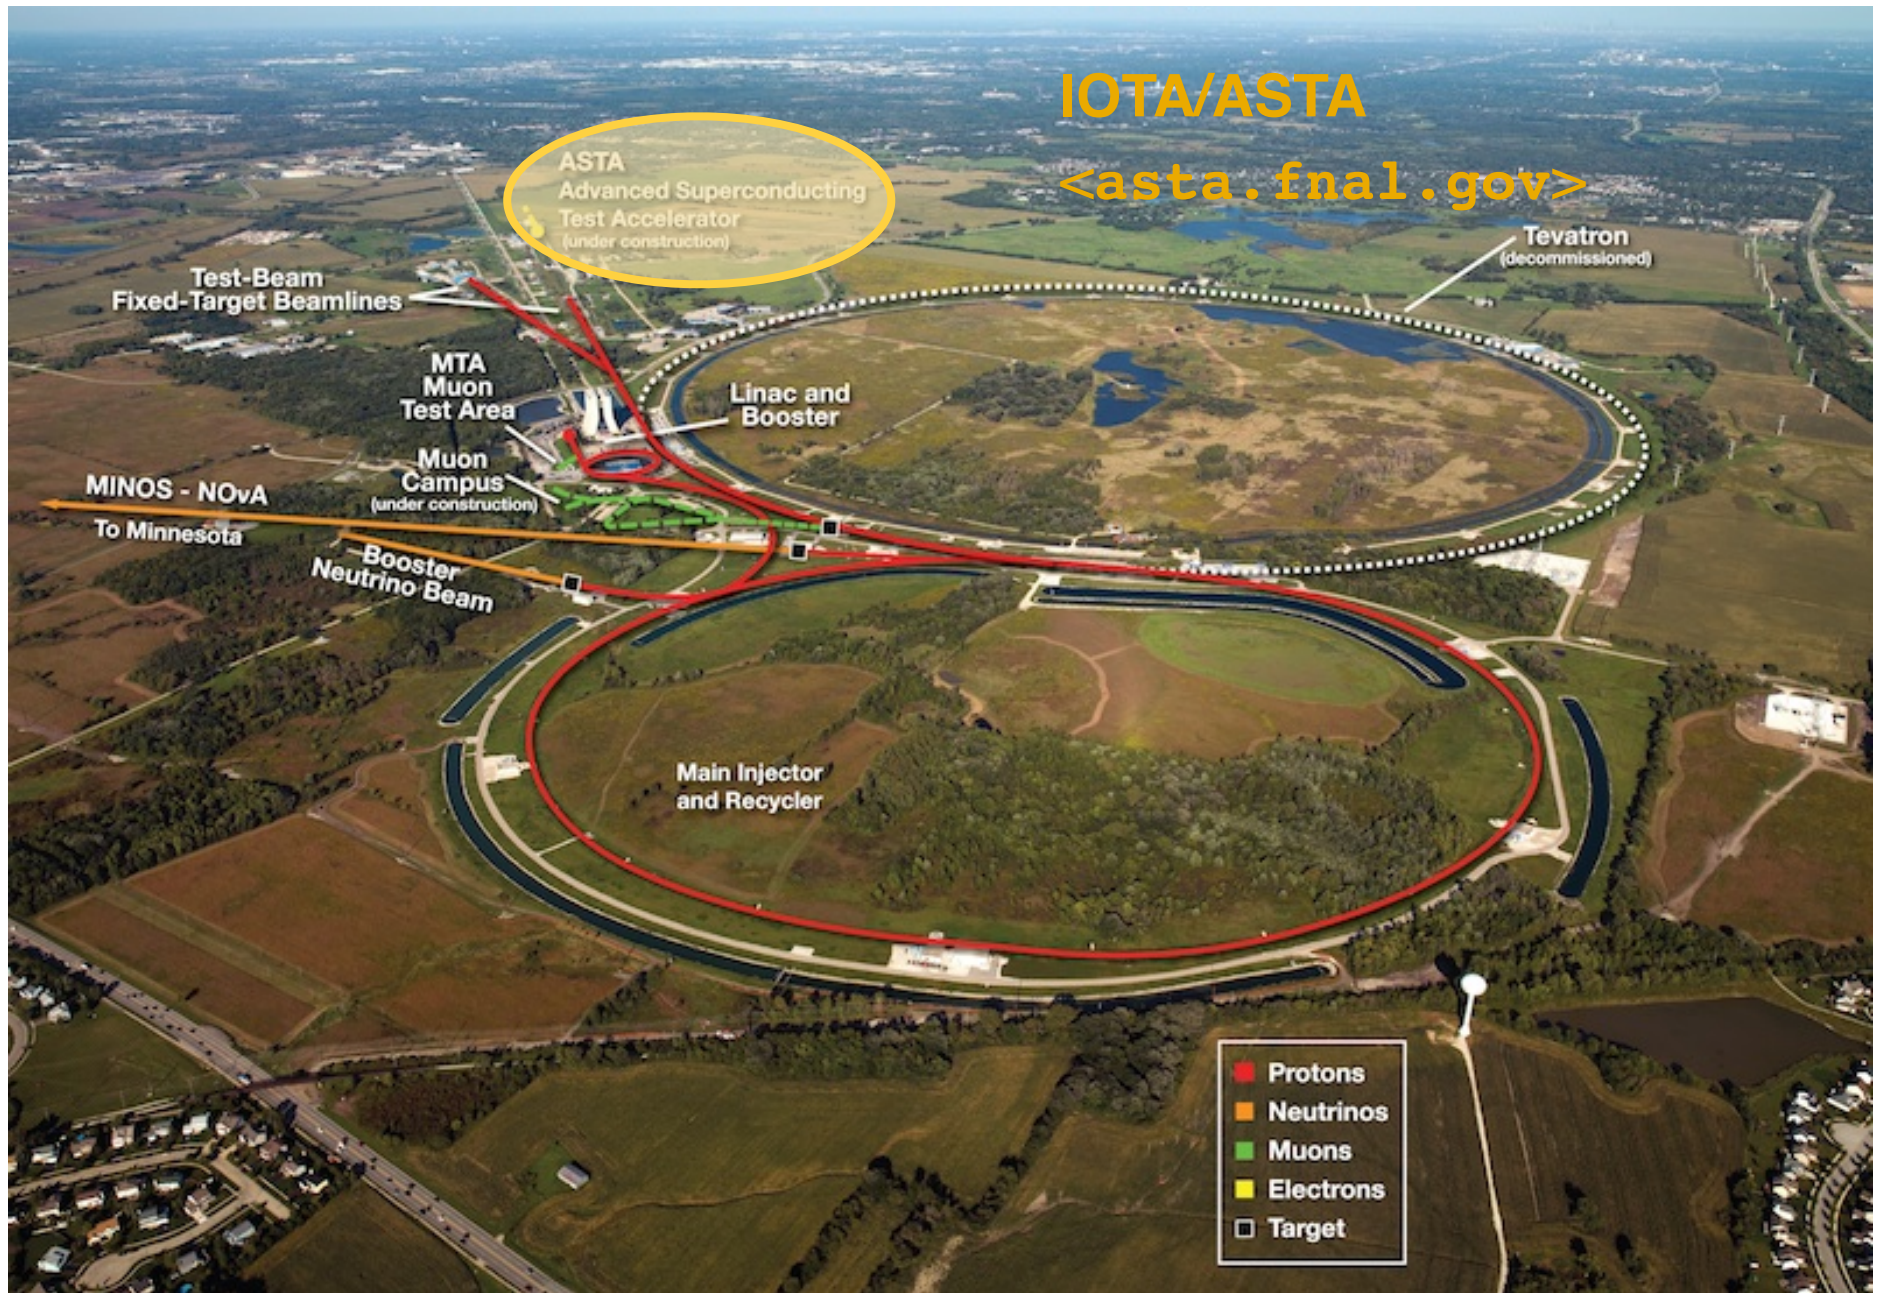

# Accelerator technologies at Fermilab

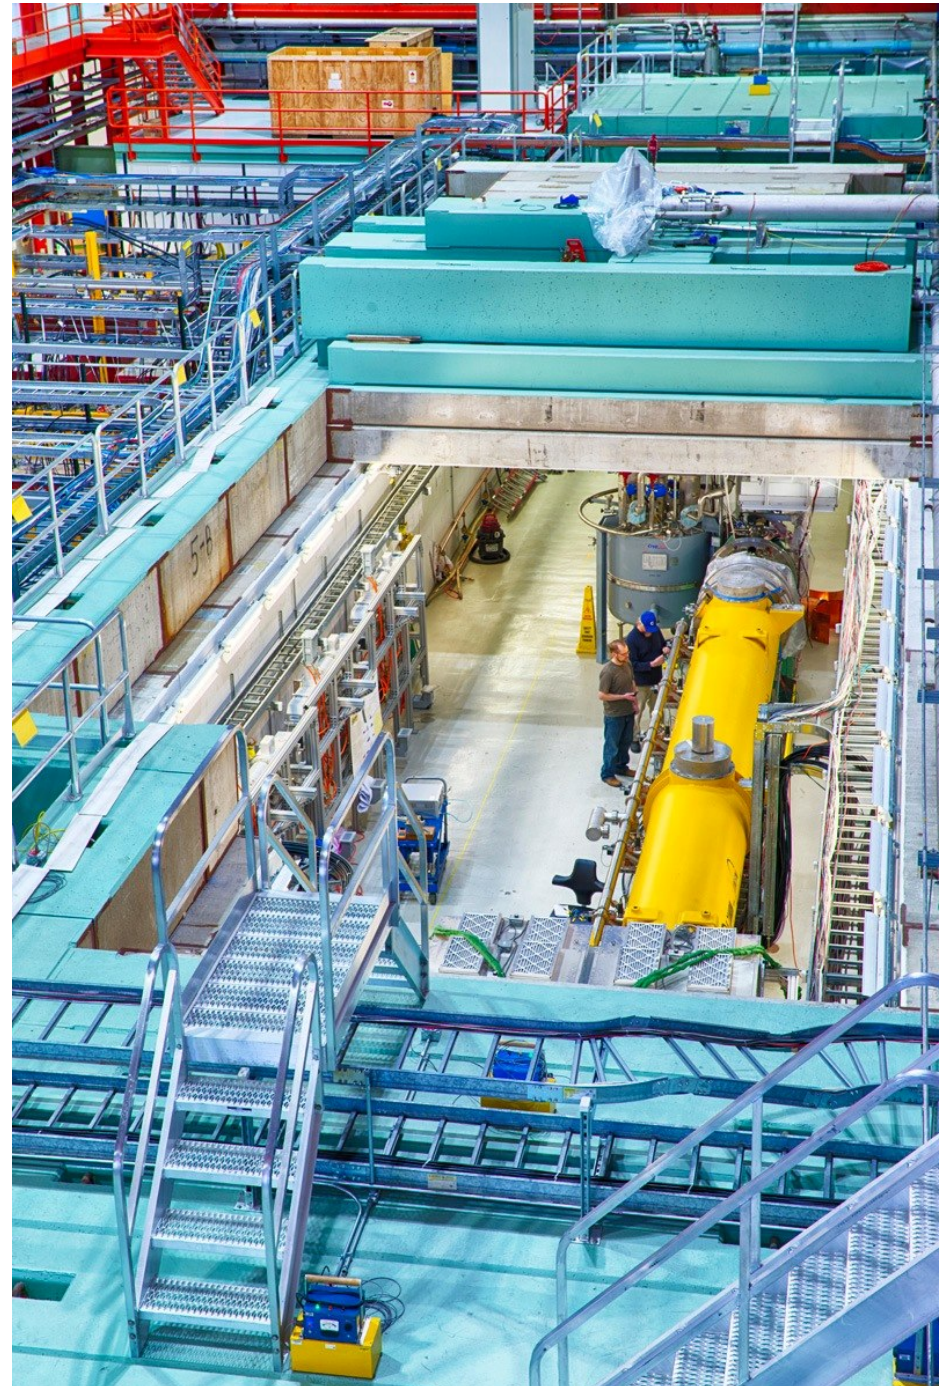

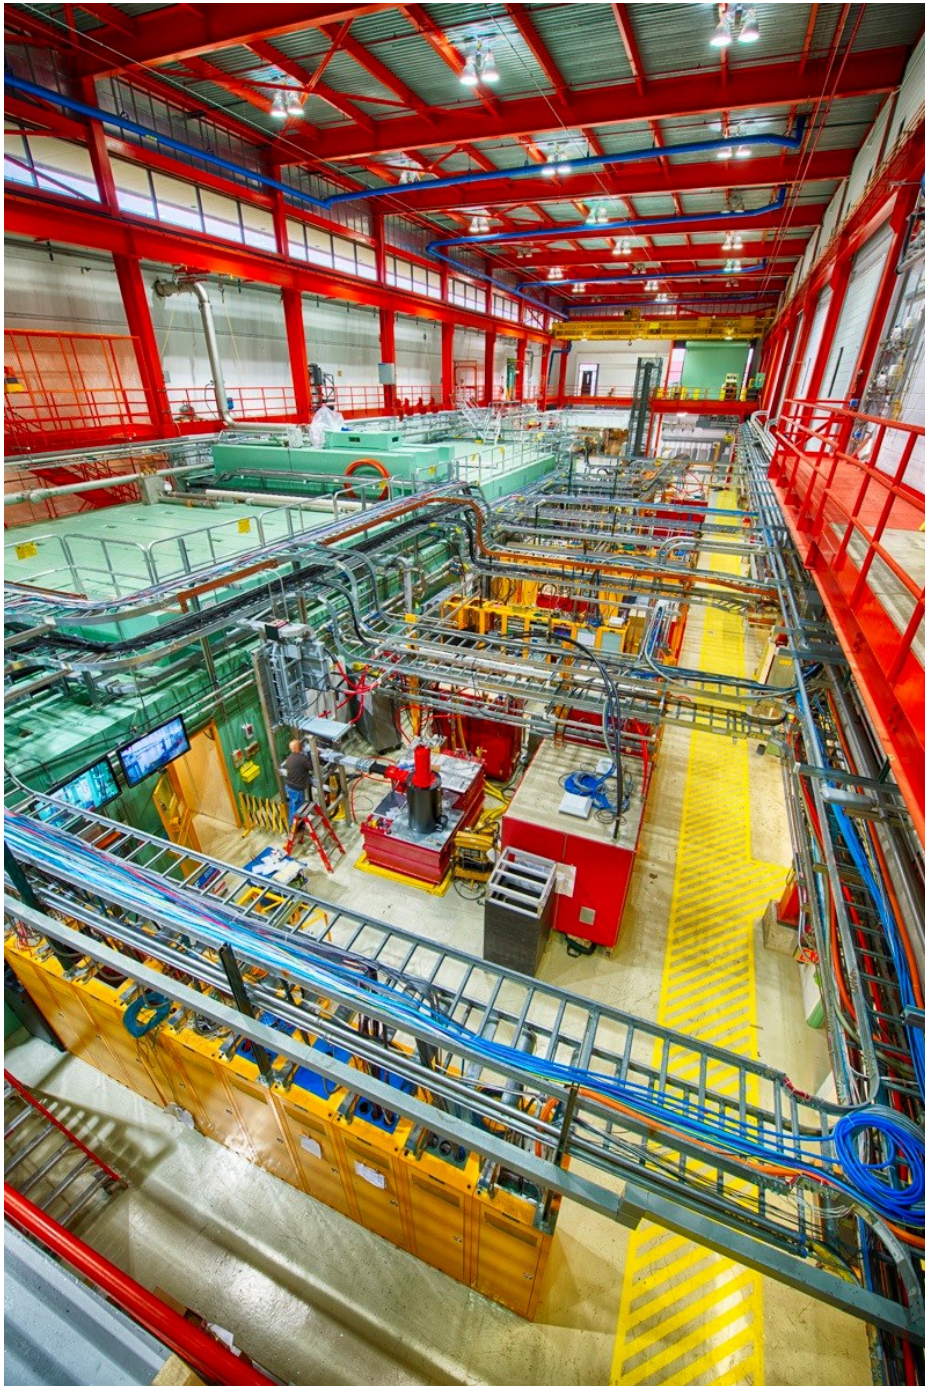

- Superconducting radiofrequency cavities
- Superconducting magnets
- Power targets
- Scientific computing

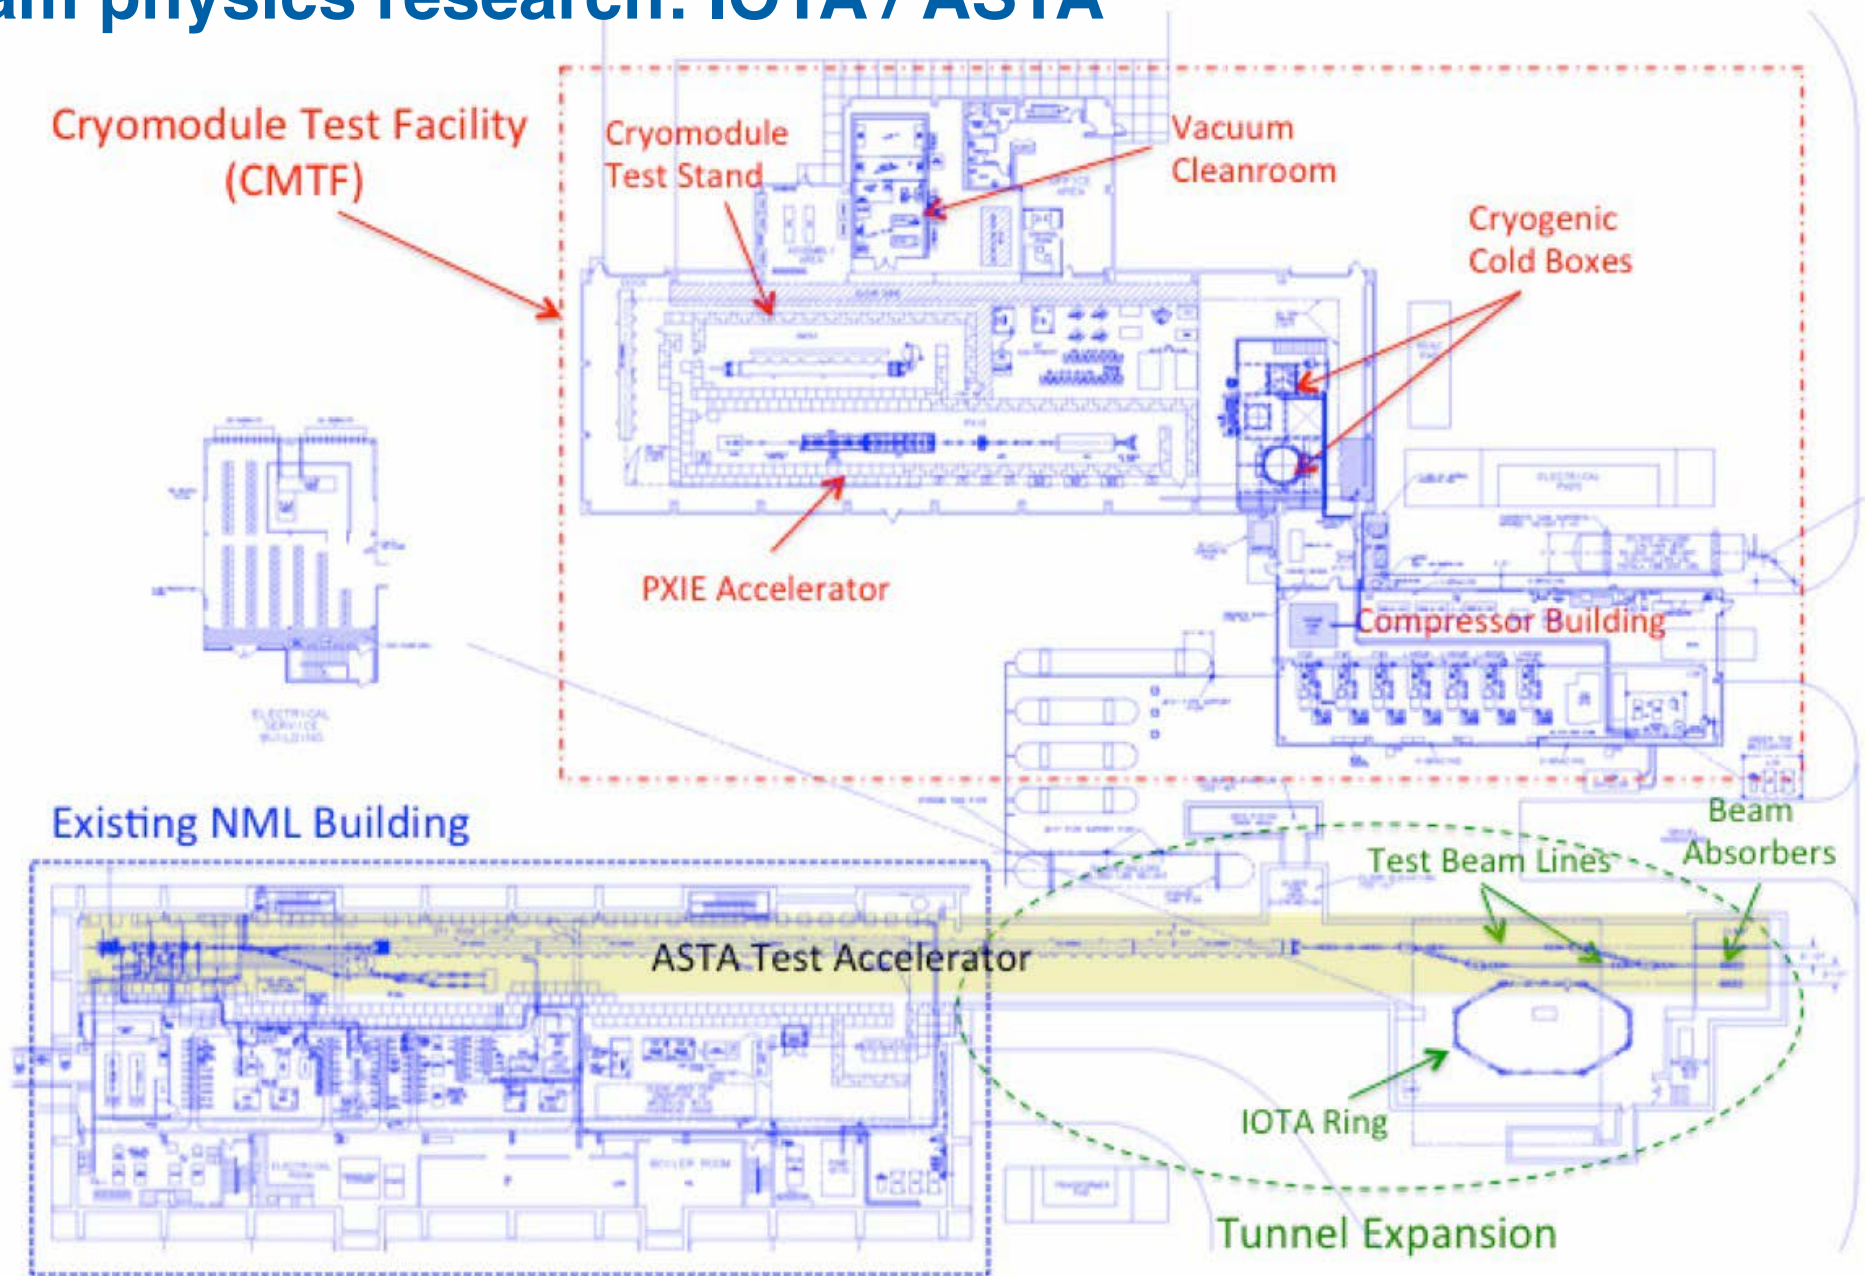

# Beam physics research

# Beam physics research facility

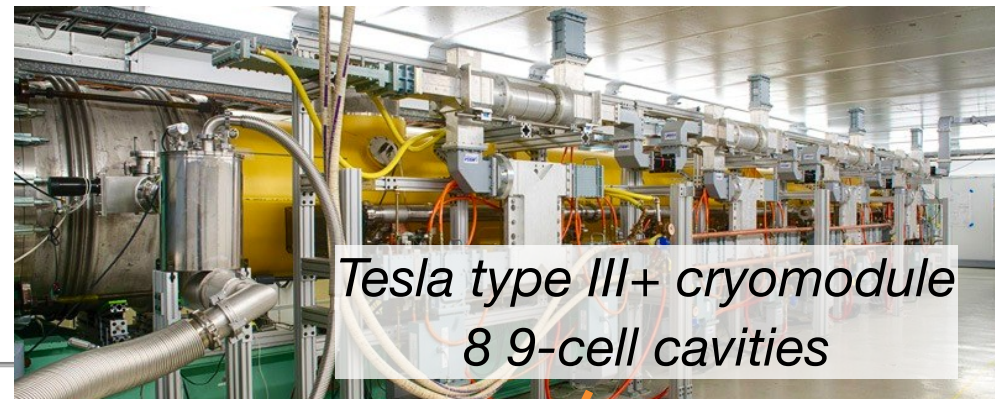

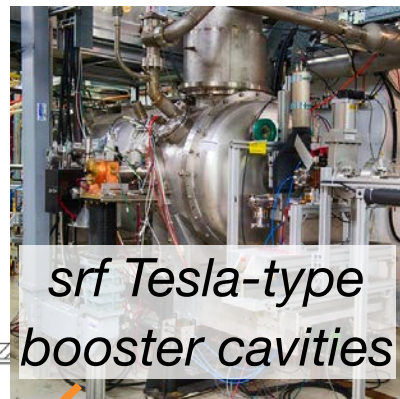

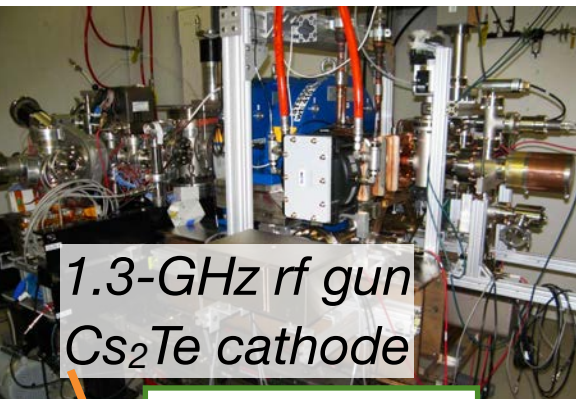

# Beam physics research: IOTA / ASTA

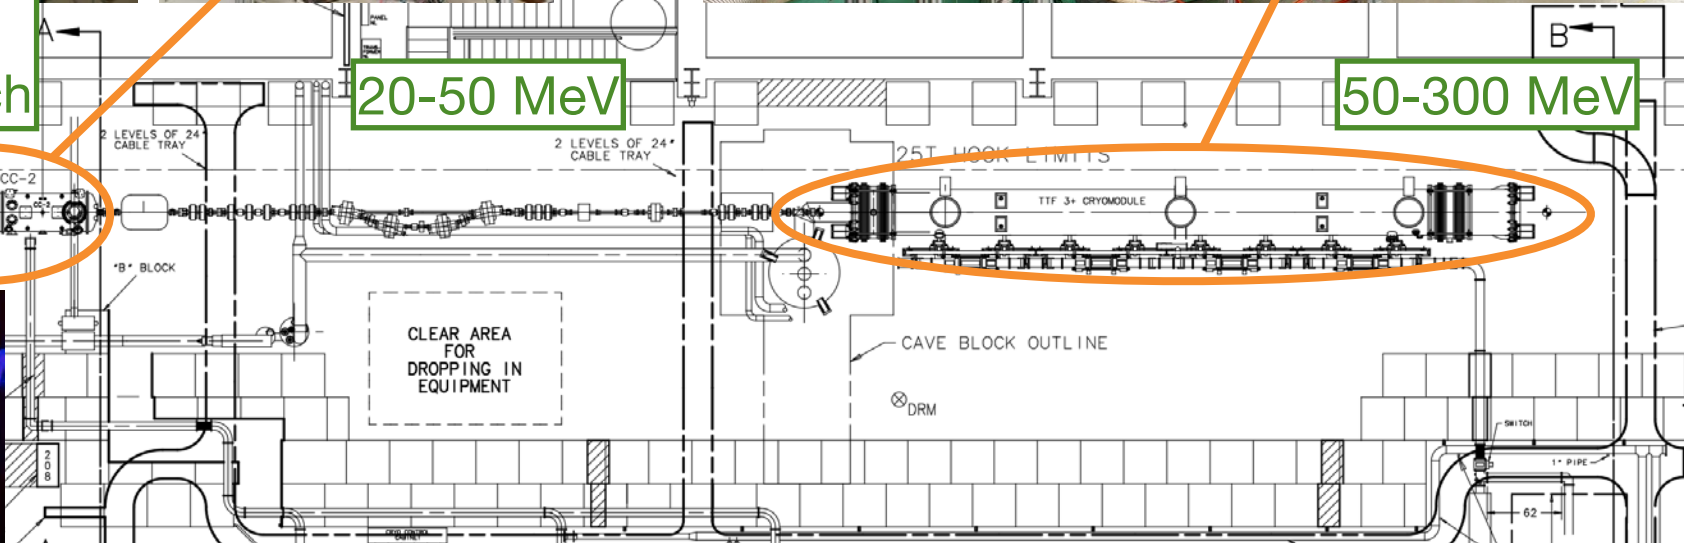

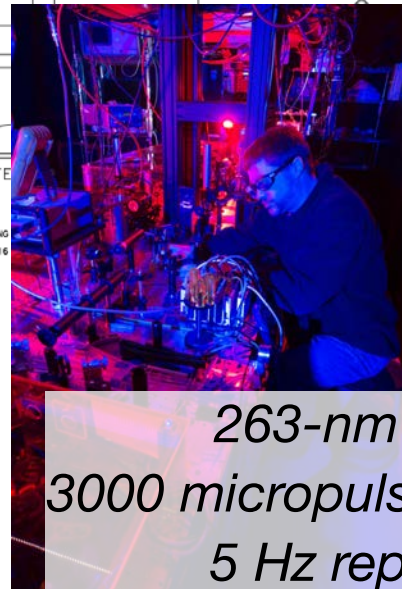

# ASTA photoinjector

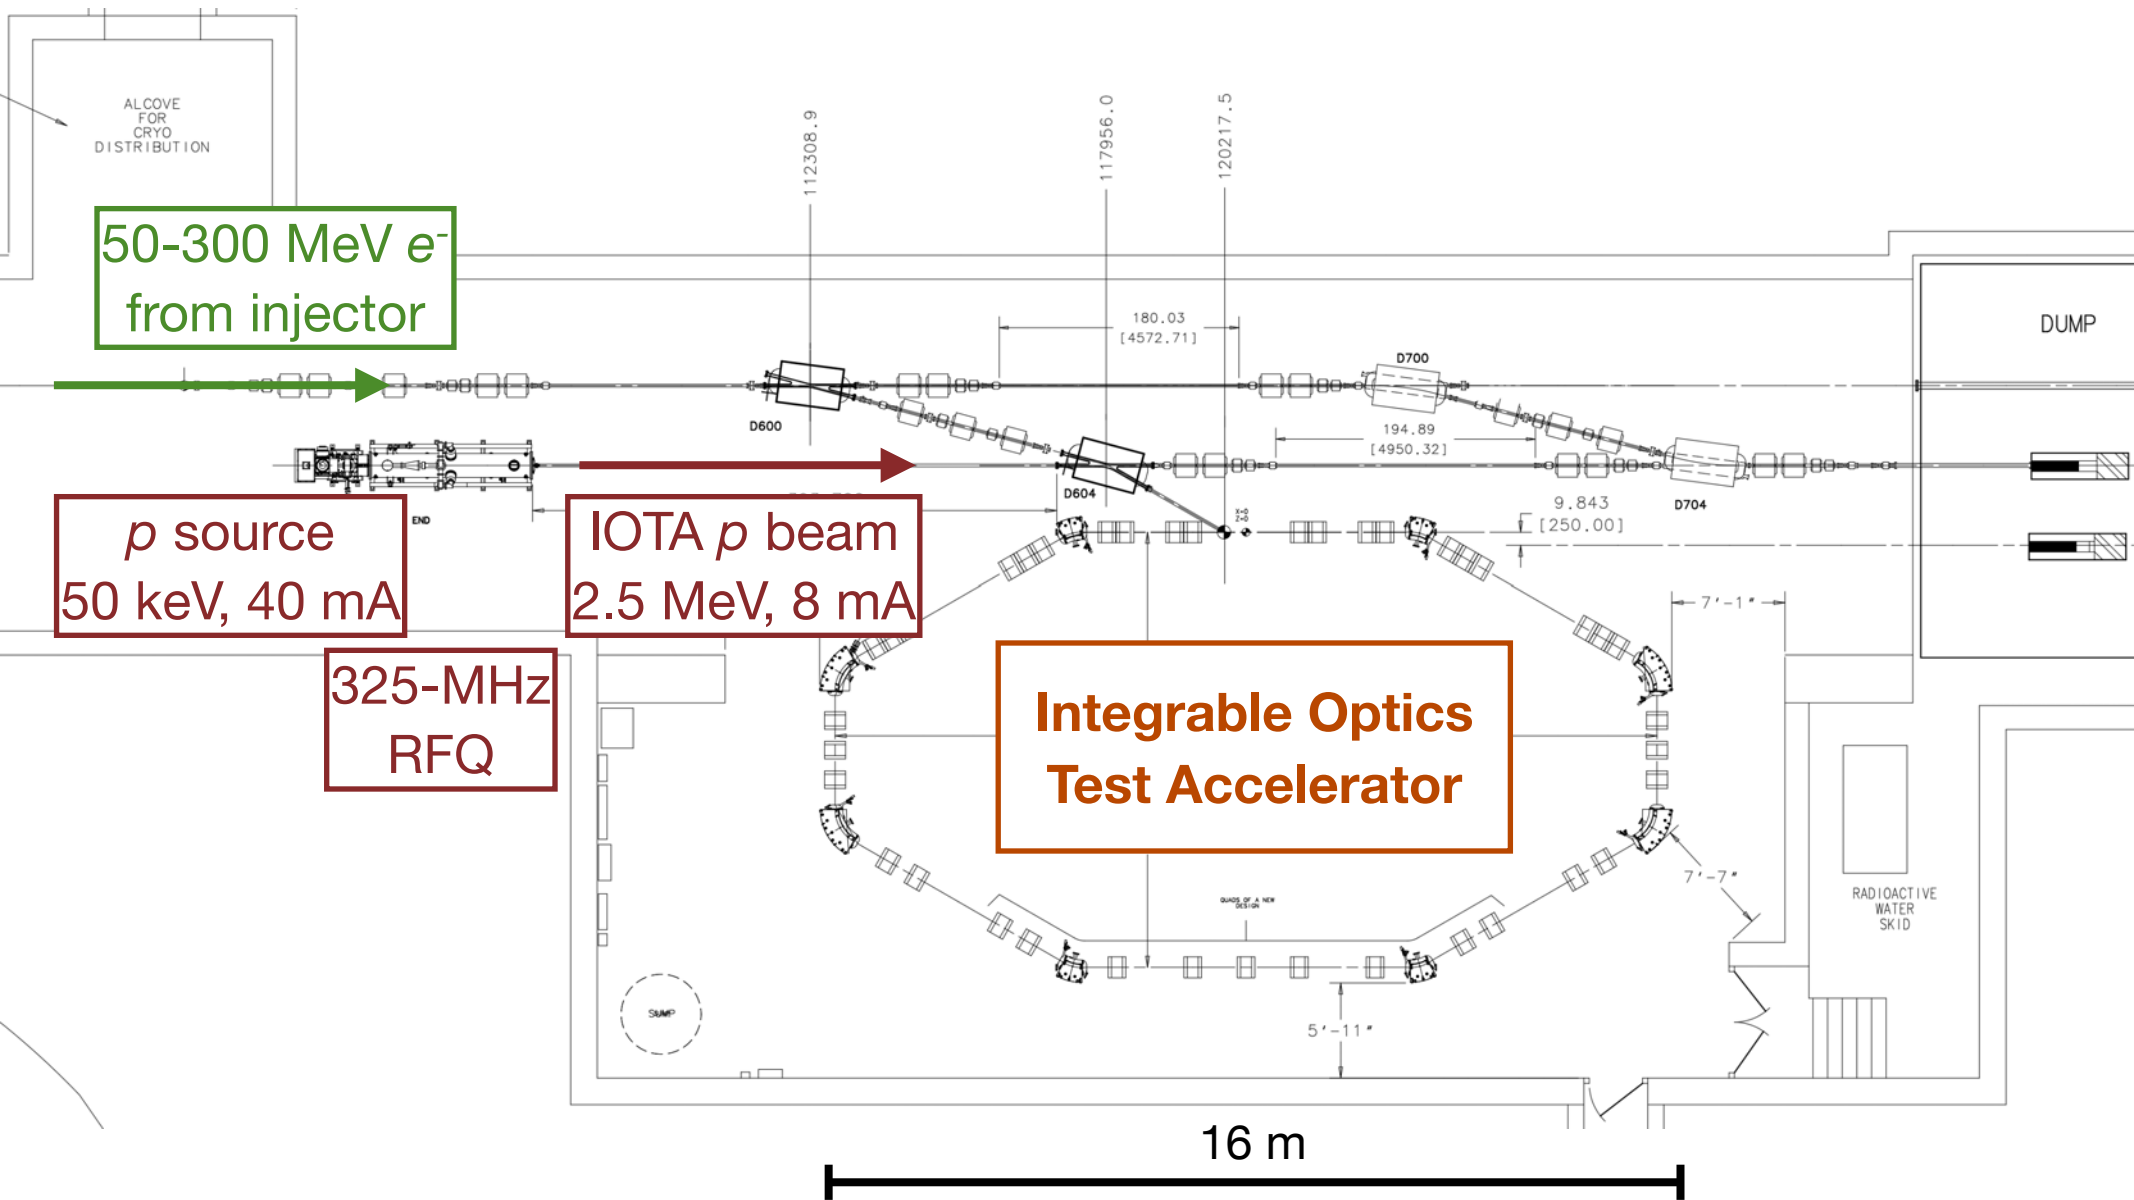

5-MeV e<sup>-</sup>  
3.2 nC/bunch

20-50 MeV

50-300 MeV

# High-energy beam lines and IOTA (under construction)

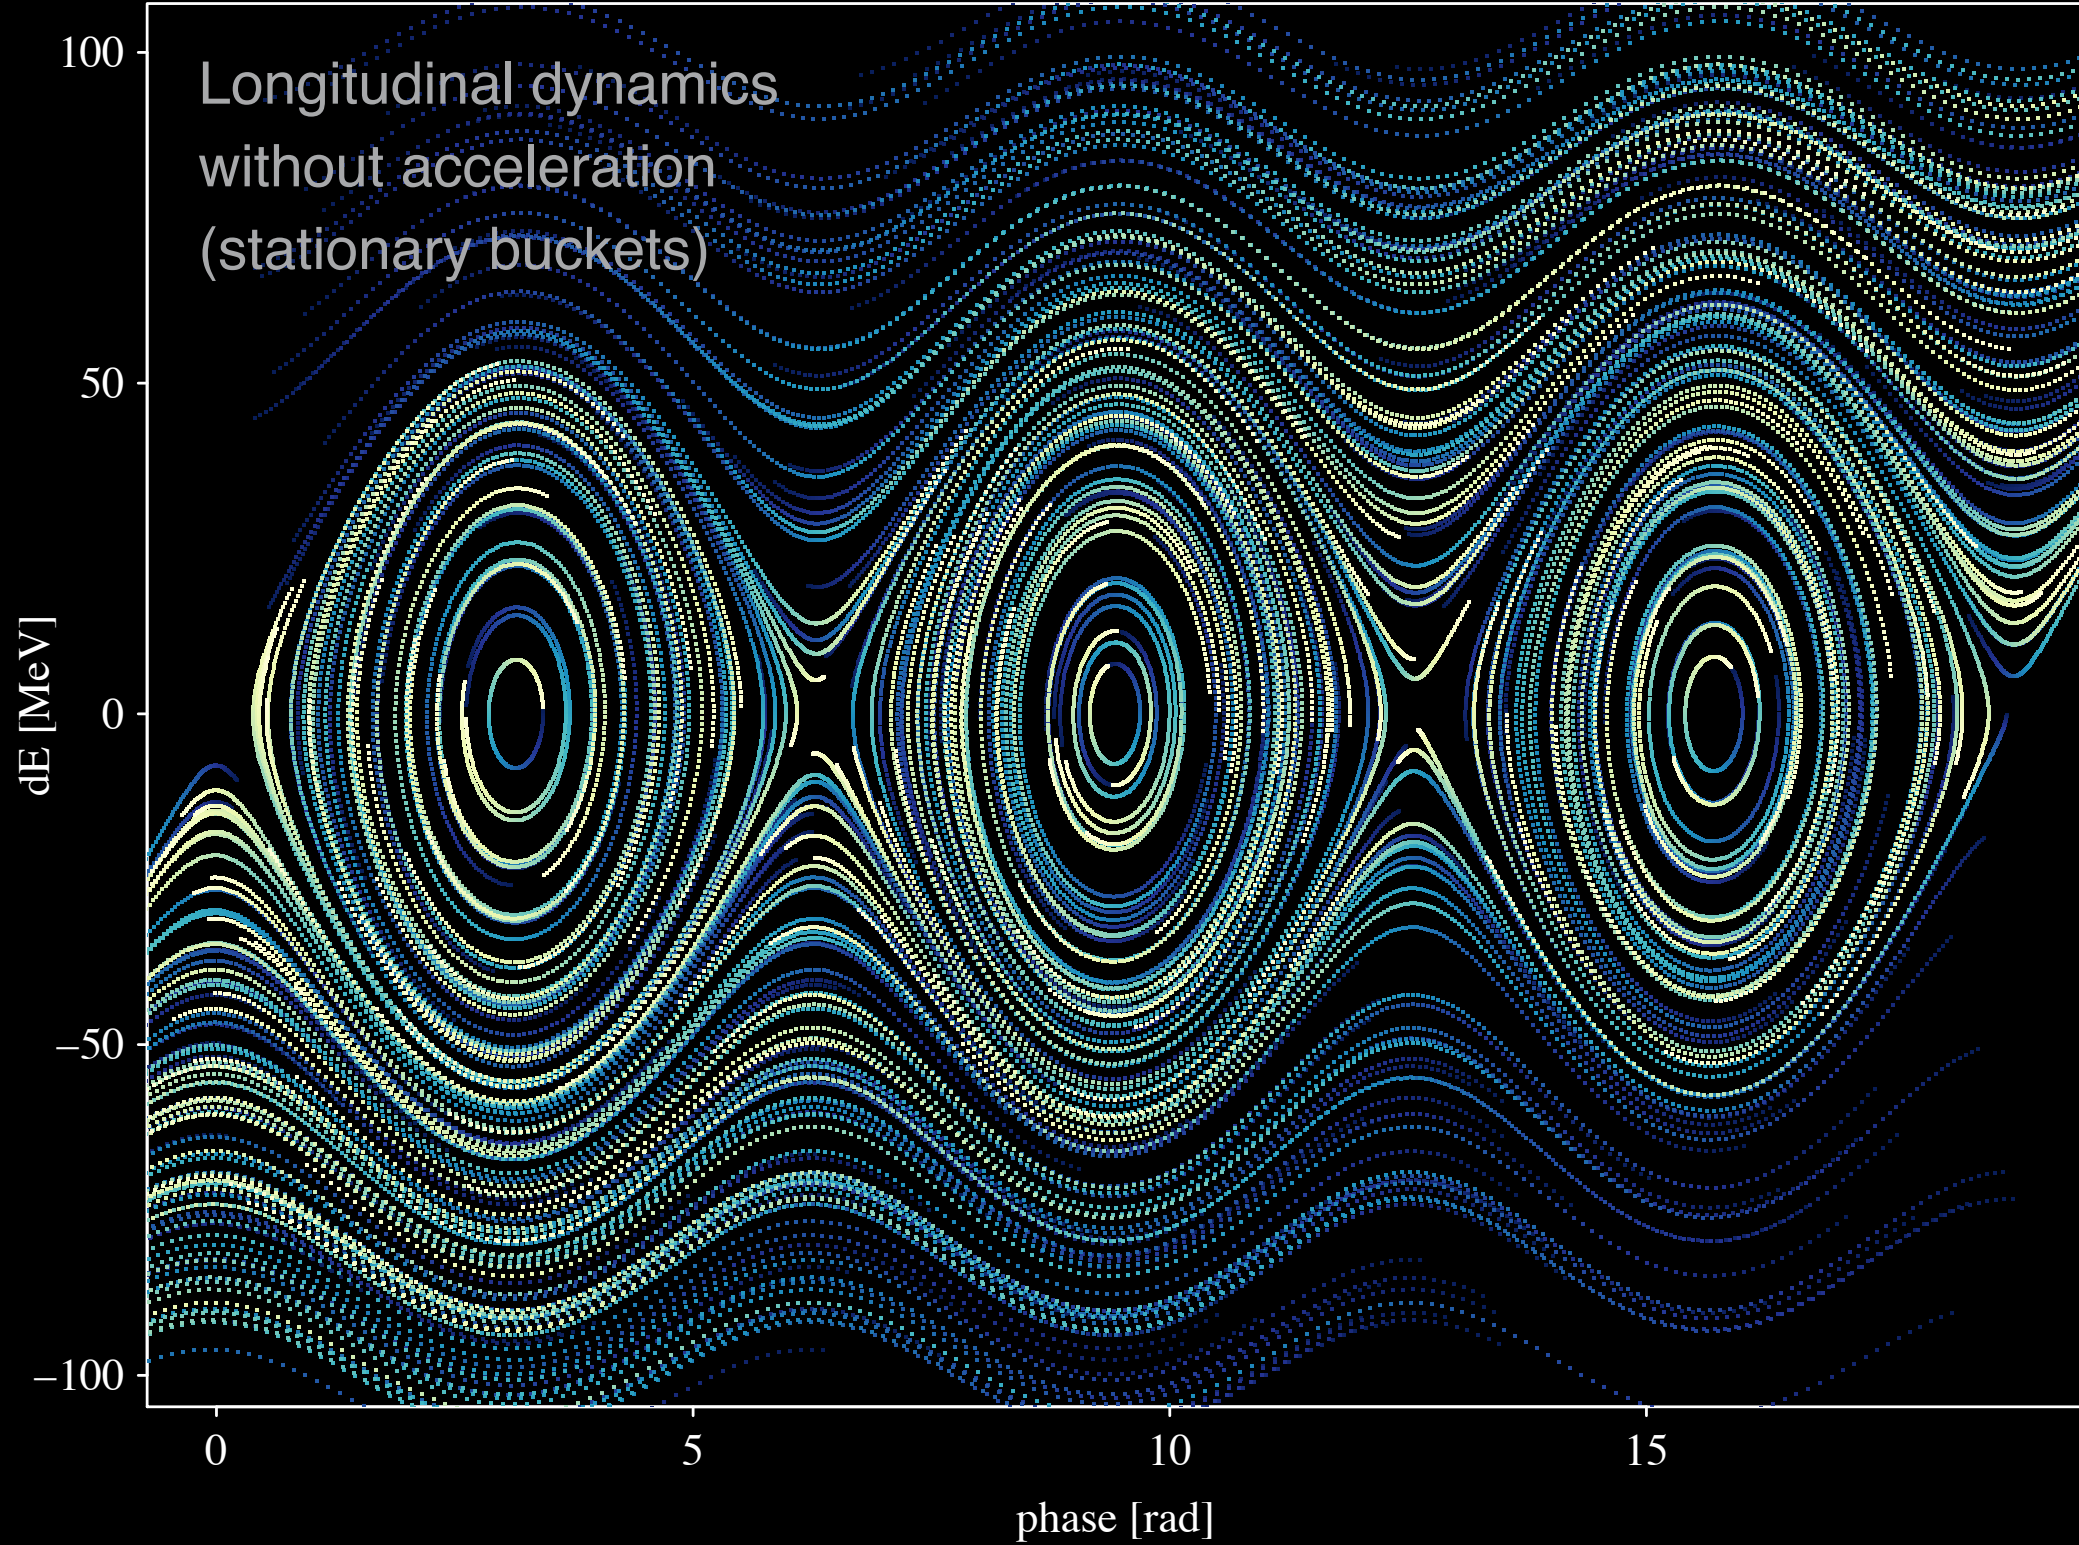

## Main research areas

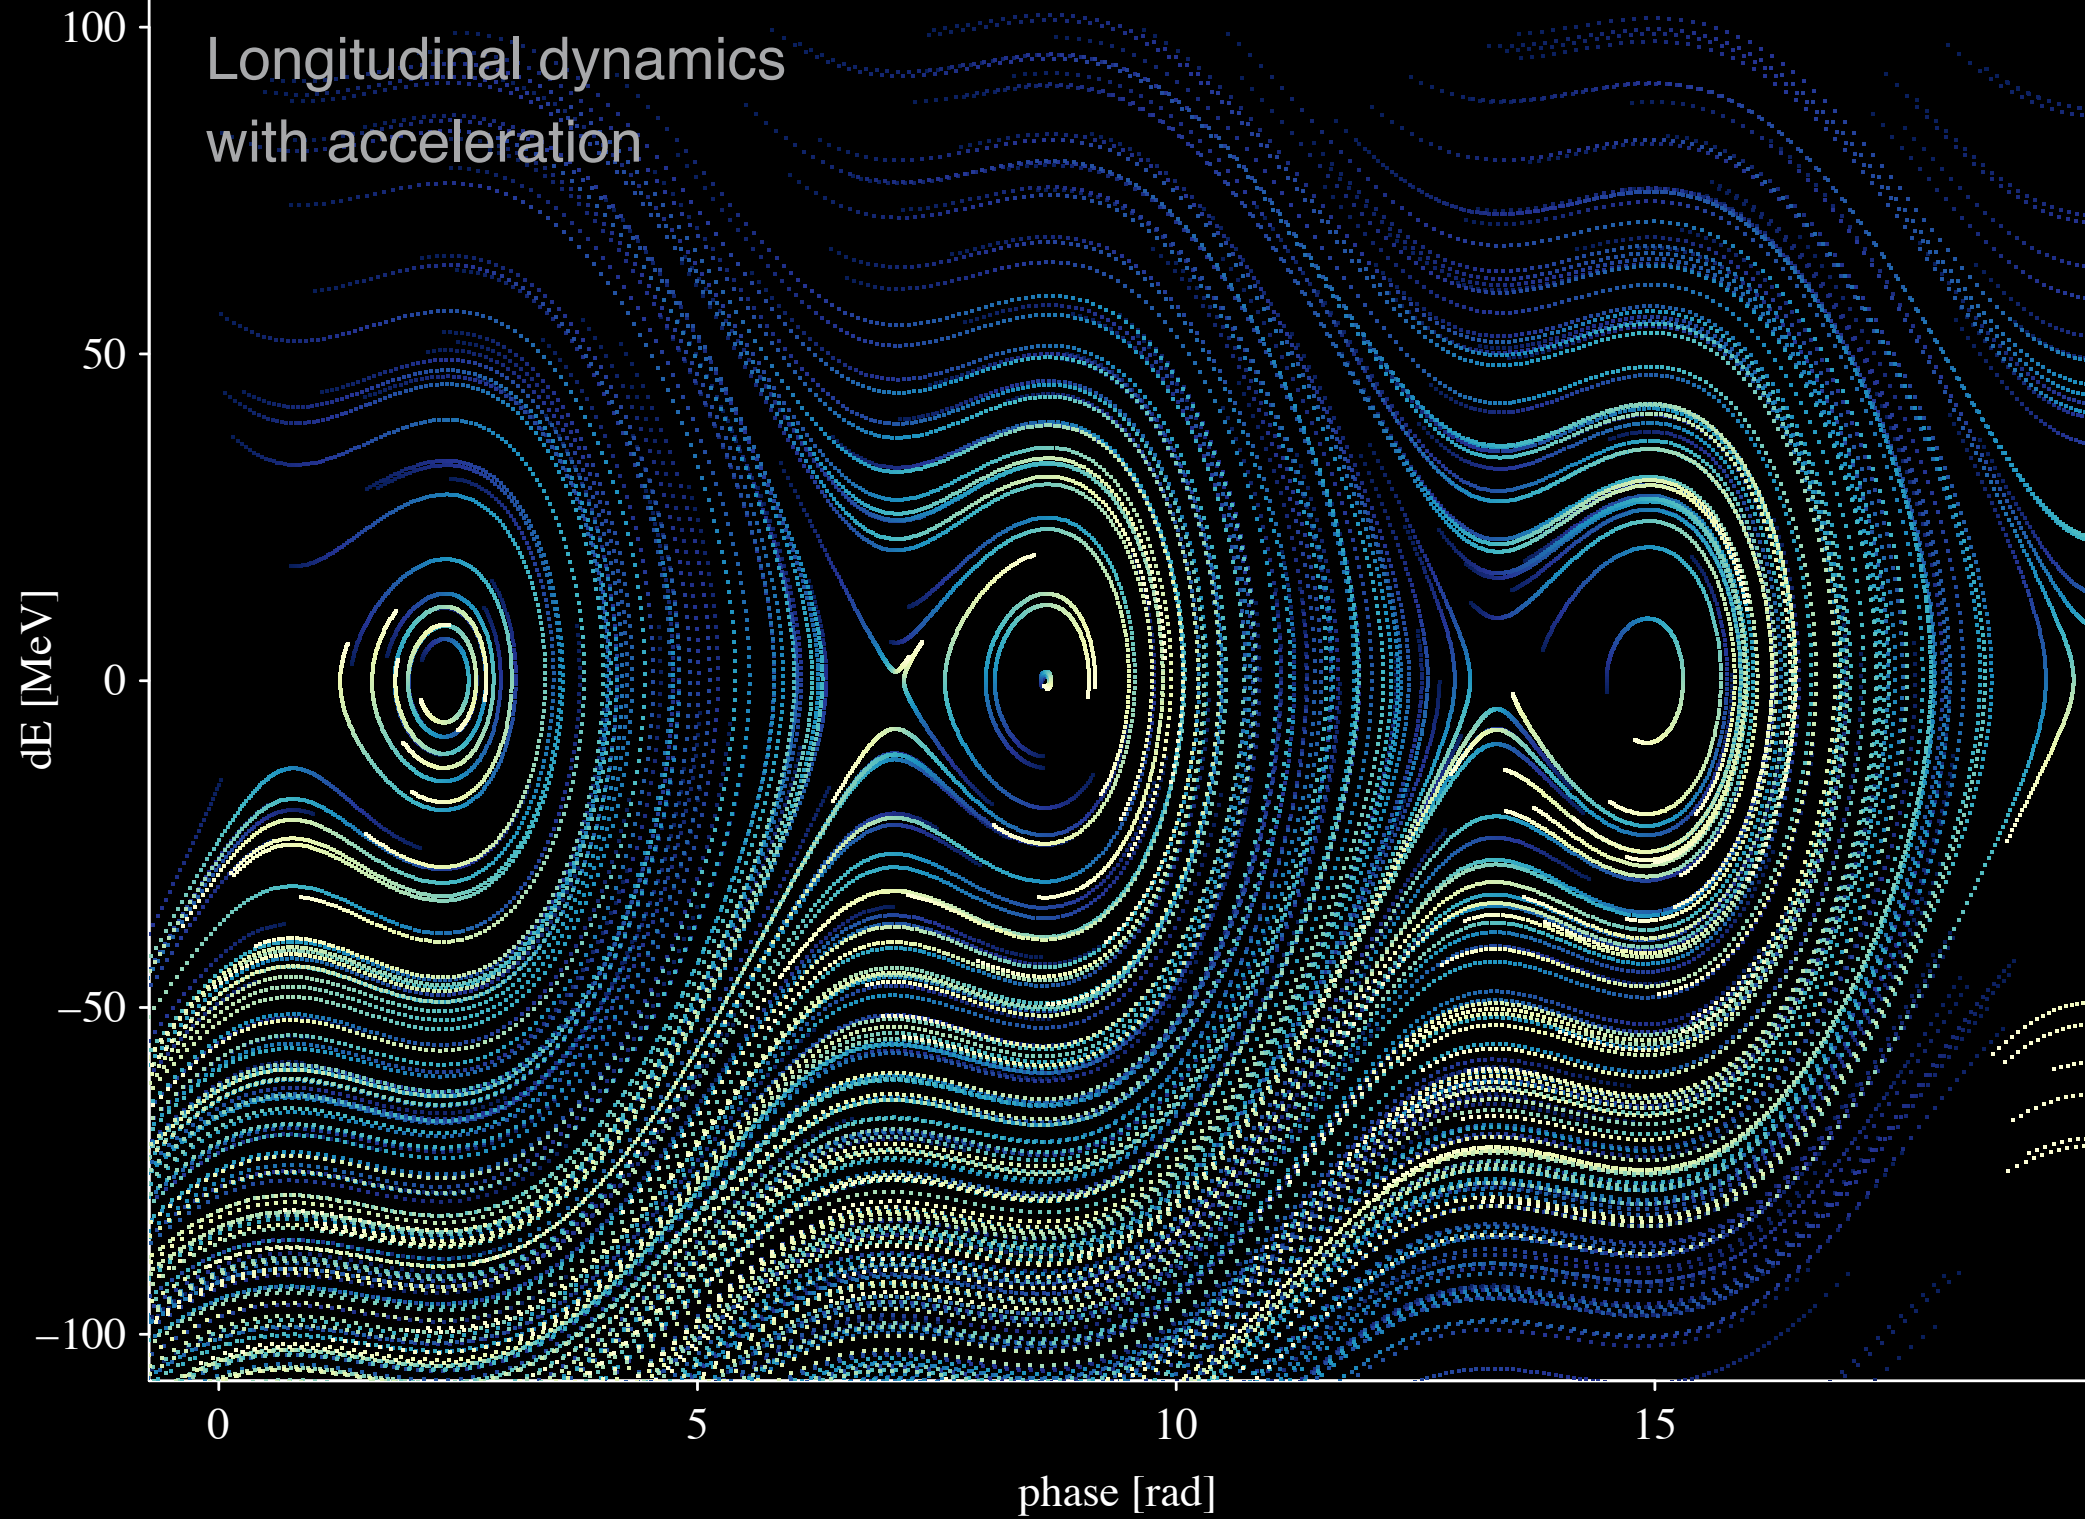

- In general, what kinds of dynamical systems are stable and robust against perturbations?
- Can intrinsically nonlinear accelerators be designed, built, and operated?
- Will nonlinear integrable lattices allow accelerators to exceed their present intensity limitations?
- Do we understand the dynamics of intense charged-particle beams under the influence of self fields?
- What kinds of radiation are generated by short electron pulses? What are their applications?

# Transverse dynamics with McMillan lens, $Q = 0.25$

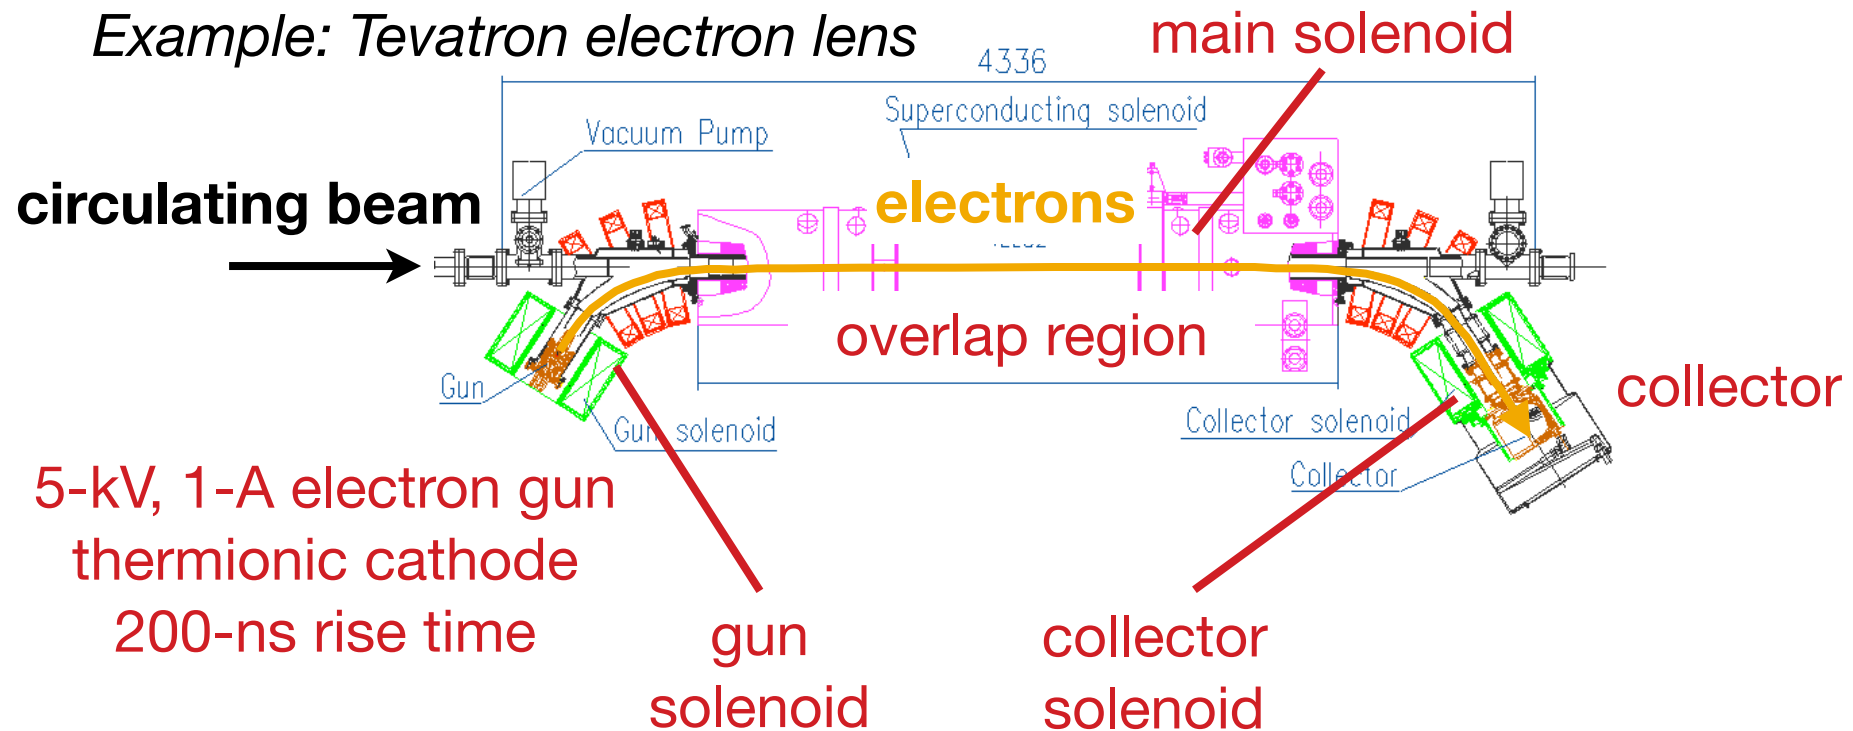

# Space-charge fields and electron-beam lenses

# What's an electron lens?

- Pulsed, magnetically confined, low-energy electron beam
- Circulating beam affected by electromagnetic fields generated by electrons
- Current-density profile shaped by cathode and electrode geometry
- Stability provided by strong axial magnetic fields

*Example: Tevatron electron lens*

For IOTA, we plan to use a resistive solenoid in the overlap region

Shiltsev et al., Phys. Rev. ST Accel. Beams **11**, 103501 (2008)

*Electron gun*

*Superconducting solenoid*

*Collector*

Electron lens (TEL-2) in the Tevatron tunnel

# Applications of electron lenses

## *In the Fermilab Tevatron collider*

- ▶ **long-range beam-beam compensation (tune shift of individual bunches)**
  - ▶ Shiltsev et al., Phys. Rev. Lett. **99**, 244801 (2007)
- ▶ **abort-gap cleaning (for years of regular operations)**
  - ▶ Zhang et al., Phys. Rev. ST Accel. Beams **11**, 051002 (2008)
- ▶ **studies of head-on beam-beam compensation**
  - ▶ Stancari and Valishev, FERMILAB-CONF-13-046-APC
- ▶ **demonstration of halo scraping with hollow electron beams**
  - ▶ Stancari et al., Phys. Rev. Lett. **107**, 084802 (2011)

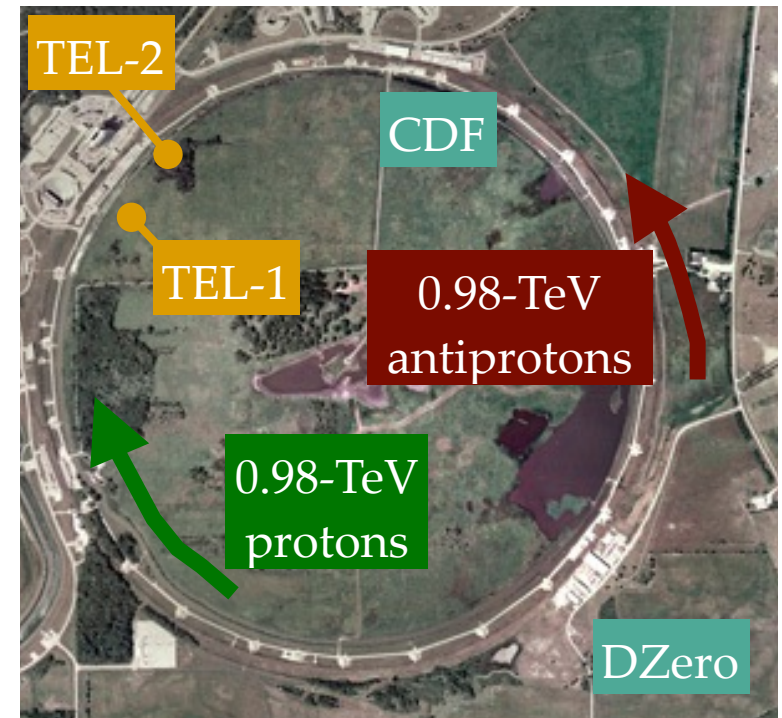

**Presently, used in RHIC at BNL for head-on beam-beam compensation, luminosity improvements**

- ▶ G. Robert-Demolaize, X. Gu, IPAC15

## **Current areas of research**

- ▶ **generation of nonlinear integrable lattices**  
in the Fermilab Integrable Optics Test Accelerator
- ▶ **hollow electron beam scraping** of protons in LHC
  - ▶ R. Bruce, IPAC15
- ▶ **long-range beam-beam compensation**  
as charged, current-carrying “wires” for LHC
  - ▶ A. Valishev, IPAC15
- ▶ to **generate tune spread for Landau damping**  
of instabilities before collisions in LHC

Tevatron electron lenses
